# The heritage of innovation

Ewellix is a global innovator and manufacturer of linear motion and actuation solutions. Today, our state-of-the-art linear solutions are designed to increase machine performance, maximise uptime, reduce maintenance, improve safety and save energy.

## Technology leadership

Our journey began **over 50 years** ago as part of the SKF Group, and our history with SKF provided us with the **expertise to continuously develop new technologies** and use them to create cutting edge products that offer our customers a competitive advantage.

In 2019, we became independent from SKF and changed our name to Ewellix. We are proud of our heritage. This gives us a unique foundation on which to build an agile business with engineering excellence and innovation as our core strengths.

## Global presence and local support

With our **global** presence, we are uniquely positioned to deliver **standard components and custom-engineered solutions**, with full technical and applications support around the world. Long standing relationships with our distributor partners allow us to support customers in a variety of different industries. At Ewellix, we don't just provide products; **we engineer integrated solutions** that help customers realise their ambitions.

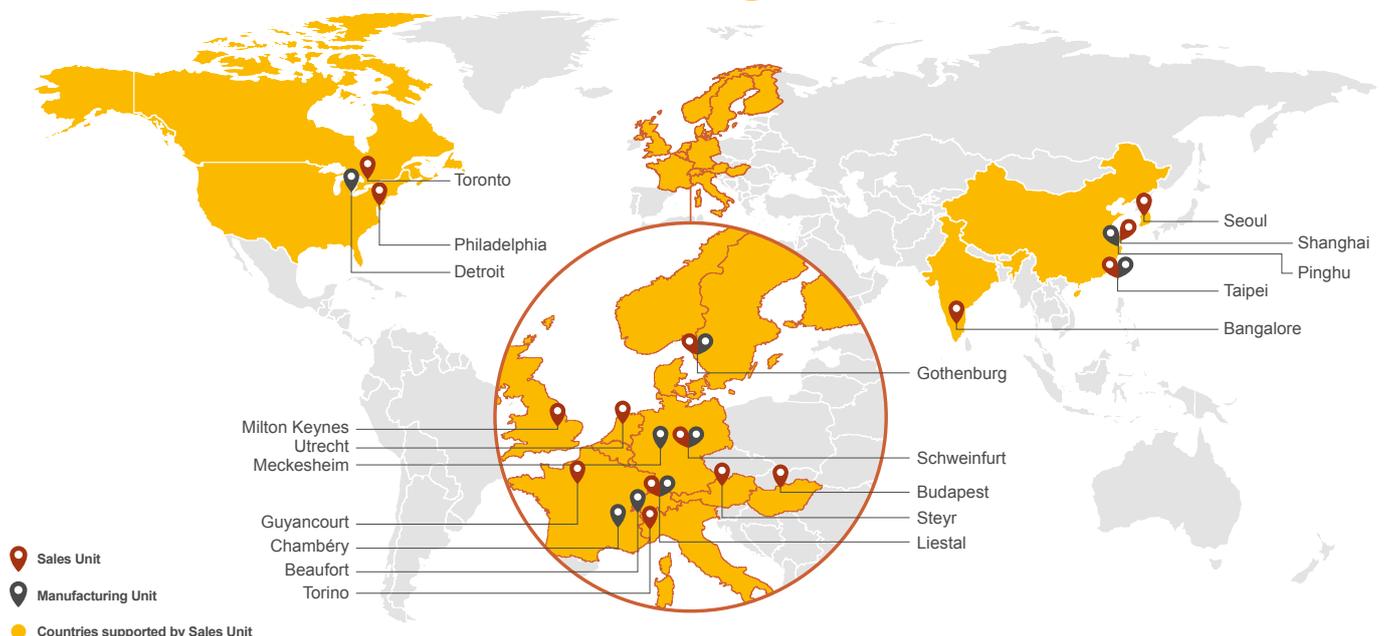

**1 400 employees**

**16 sales units**

**9 factories**

# Trusted engineering expertise

Our industry is in motion; pushing towards solutions that reduce environmental impact and leverage new technology. We provide technical and manufacturing expertise to overcome our customers' challenges.

## Engineering for the future

We work in a **wide range of industries**, where our solutions provide key functionality for business critical applications.

For the **medical industry**, we provide precision components for use in core medical equipment.

Our unparalleled understanding of **industrial automation** systems is based on decades of research into advanced automation components and techniques

Our deep knowledge of **mobile machinery** provides powerful and reliable electromechanical solutions for the harshest conditions. In an **industrial distribution** setting, we supply linear expertise to our partners, empowering them to serve customers with greater efficiency

## We offer excellence

We have a **unique understanding of linear equipment** and how it's integrated in customers' applications to provide the best performance and machine efficiency.

**We assist our customers** by creating equipment that runs faster, longer and safer and that is sustainable.

We provide a wide variety of **linear motion components** and **electromechanical actuators** for equipping any automation application, helping our customers **reduce its footprint, energy use and maintenance**.

We push for lower energy consumption that **increases productivity and reduces the environmental impact**.

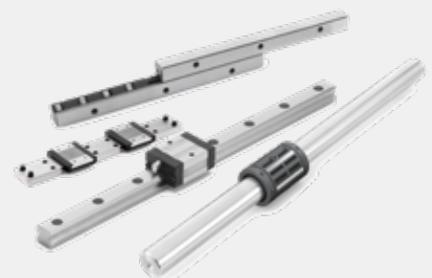

### Actuation systems

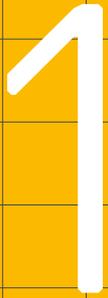

### Ball and roller screws

### Linear guides and systems

1

## Introduction

Energy savings up to 90%

# Core technologies

## Actuation technology

Our extensive experience and knowledge of actuation systems allows us to satisfy the most demanding requirements using linear actuators, telescopic pillars and control units.

### Linear actuators

We offer a wide range of low- to medium-duty actuator designs and configurations for simple industrial or specific health care applications. Our versatile range provides everything from low- to high-load capacities and medium operating speeds to quiet and aesthetically designed systems (↳ **fig. 1**).

### High-performance actuators

Our range of high-duty actuators meets the needs of demanding industrial applications with high loads and speeds in continuous operation. These actuators provide the best controllability and reliability for programmable motion cycles (↳ **fig. 2**).

### Telescopic pillars

We offer a wide range of options for several applications. In addition, our telescopic pillars are quiet, robust, powerful, resistant to high offset loads and feature attractive designs (↳ **fig. 3**).

### Control units

Ideal for applications focused on system control, Ewellix control units provide connections for foot and hand or desk switches (↳ **fig. 4**).

Fig. 1

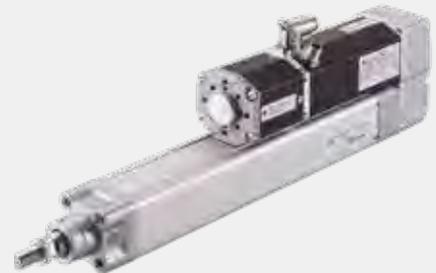

Fig. 2

Fig. 3

Fig. 4

## Ball and roller screw technology

For applications that require driving by transforming rotary action into linear motion, we provide a comprehensive range of solutions including rolled ball screws, roller screws and ground ball screws.

### Miniature ball screws

Ewellix miniature ball screws are very compact and provide silent operations (→ **fig. 5**).

### Rolled ball screws

We offer several, highly precise recirculating systems to cover most application requirements which can reduce or eliminate backlash (→ **fig. 6**).

### Ground ball screws

Ewellix ground ball screws offer increased rigidity and precision.

### Roller screws

Ewellix roller screws go far beyond the limits of ball screws providing the ultimate precision, rigidity, high speed and acceleration. In addition, backlash can be reduced or eliminated. Long leads are available for very fast movements (→ **fig. 7**).

Fig. 5

Fig. 6

Fig. 7

## Linear guide technology

To provide optimal solutions for all your guiding needs, our product range features shaft guidings, profile rail guides and precision rail guides.

Fig. 8

Fig. 9

Fig. 10

### Linear ball bearings

Cost-effective, simple and self-aligning, Ewellix shaft guidings feature unlimited stroke, adjustable preload and excellent sealing performance. They are also available in corrosion-resistant versions and pre-mounted on an aluminium housing as a unit (↳ **fig. 8**).

### Precision rail guides

With a range of modular options, Ewellix precision rail guides feature different rolling elements and cages. These guides feature high precision, high load carrying capacity and stiffness, and also come with an anti-creeping system. They are also available as a ready-to-mount kit (↳ **fig. 9**).

### Profile rail guides

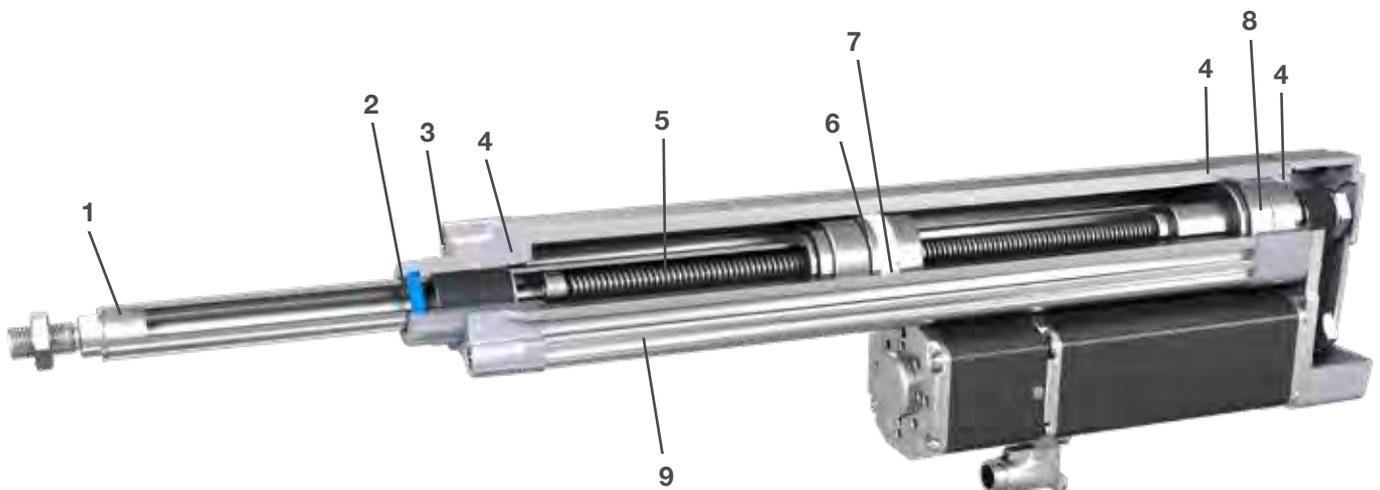

Featuring unlimited stroke through joint rails and excellent rigidity, capable of withstanding moment loads in all directions, Ewellix profile rail guides are ready to mount and provide easy maintenance along with high reliability. They are available in ball or roller versions as well as standard and miniature sizes (↳ **fig. 10**).

# Product overview

## Linear actuators

Electromechanical linear actuators enable precise, controlled, and repeatable push/pull movements in linear drive applications. Linear actuators serve as efficient, virtually maintenance-free, and environmentally friendly alternatives to hydraulic or pneumatic types.

Actuators with a modular design and open architecture offer opportunities to choose and integrate components to achieve customized solutions within existing envelopes. Application potential expands with the introduction of technologies for specific purposes, such as hall sensors, limit switches, potentiometers, friction clutches, or back-up nuts.

1. Push tube which moves the load
2. Shaft seal to protect against contaminants ingress
3. Opening to let the actuator breath (not visible)
4. Flat seal between housings
5. Screw with nut to transform rotative movement into linear movement
6. Magnet ring for proximity sensors to detect position
7. Anti-rotation device
8. Bearing to hold the load
9. Protection tube

Lead screw

Precision rolled ball screws

Roller screws

## Screws

Ball and roller screws are key components to build electric cylinders. They transfer rotary movements of the motor into linear movements. Their efficiency and their load and speed capabilities have a very big influence on the performance of electric cylinders.

Thanks to decades of experience with manufacturing ball and roller screws and continuous product and process development, Ewellix builds electric cylinders with precision screw solutions that fulfill the most demanding applications in terms of efficiency, precision, durability and value. All screws are made of high-strength materials with specific heat-treatment.

### Lead screw

These screws transmit torque into linear motion through direct sliding friction. A typical assembly consists of a steel screw and plastic nut. Some of the electric cylinders are equipped with lead screws with a relatively high friction coefficient that makes them well suited for self-locking application. Lead screw actuators accommodate high static force, withstand excessive vibration, operate quietly, and represent cost-effective solutions.

### Precision rolled ball screws

Ewellix ball screw assemblies provide high performance solutions suitable for a wide range of applications where high loads, precision driving, durability and value are prerequisites.

High technology machinery associated with precise control of the cold forming and metallurgical processes enable the production of screws that offer virtually the same accuracy and performance of ground ball screws, but at a lower cost. Standard lead precision is G9, according to ISO 286-2:1988. Ewellix production meets G7 lead precision for screw shaft nominal diameter starting from 20 mm. On request, Ewellix can deliver ball screws with G5 lead precision, according to ISO 3408-3:2006, defined for positioning screws, and matching the lead precision of G5 ground ball screws.

### Roller screws

Roller screws offer a performance level far beyond the capabilities of ball screws. Planetary roller screws are well suited for heavy loads, high duty, high rotational speed, high linear speed, high acceleration and rigidity, and for operation in harsh environments.

For very high precision applications, recirculating roller screws with a very fine lead of thread allow high positioning accuracy, repeatability and exceptional rigidity.

For applications where compactness and low weight are essential, Ewellix also offers fully integrated cylinders, built with inverted roller screws.

# Product range comparison

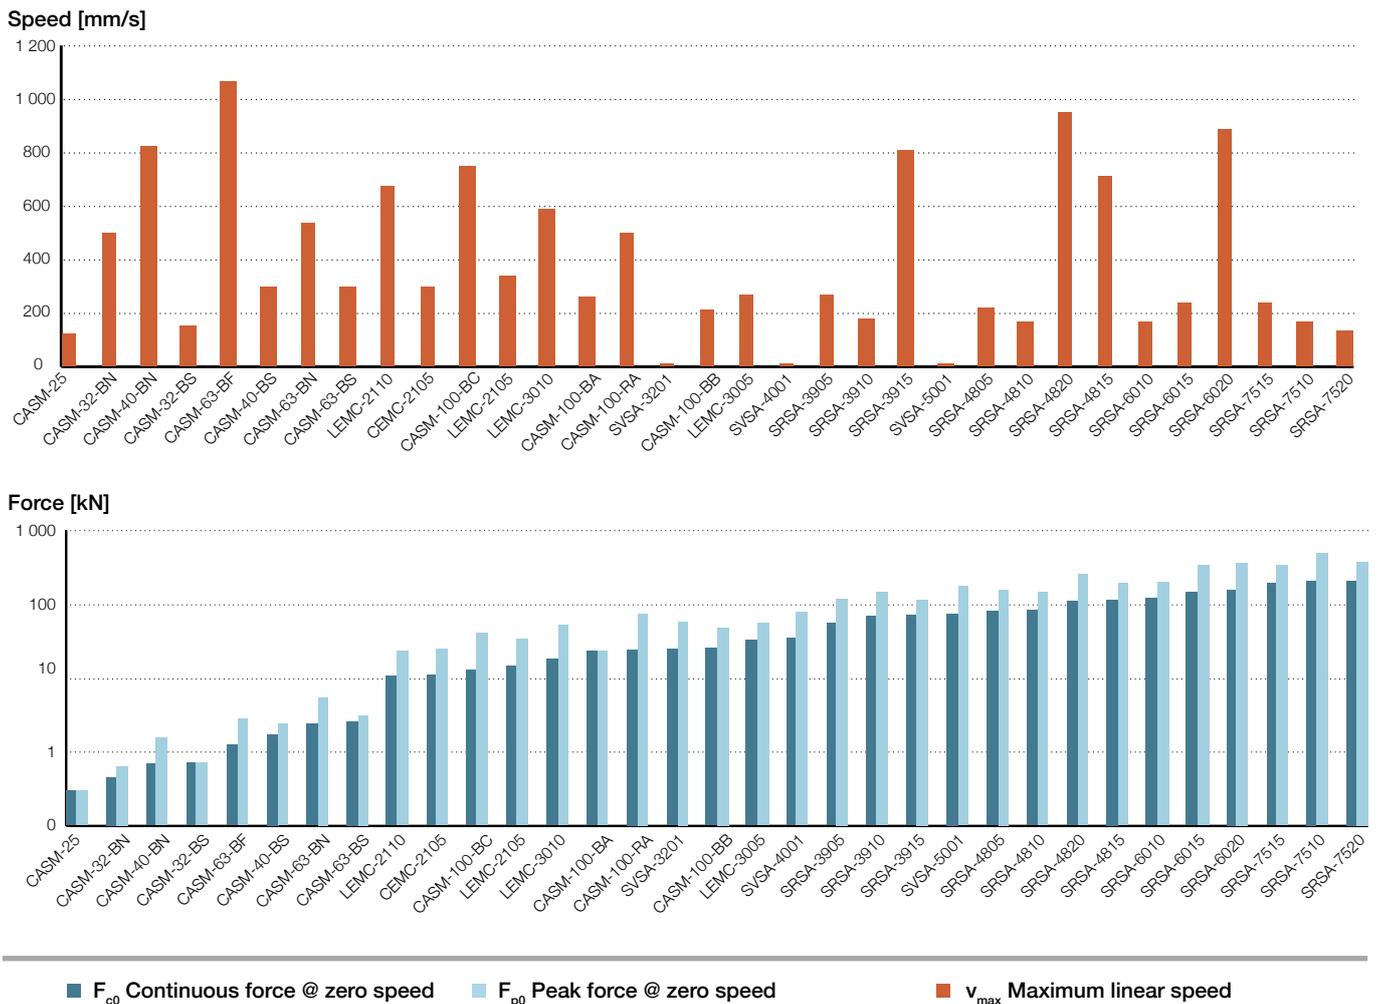

## Force and speed capabilities

The graph below (↳ **diagram 1**) provides a quick overview about the continuous force, peak load capabilities and the speed of the high performance actuators with servo motors. Use this graph to quickly evaluate which actuator could fit best in your application.

The continuous force describes the force the actuator can push or pull continuously without overheating. The peak load is the maximum force an actuator can push or pull for a short time (peak) at low speed, without being mechanically destroyed or by overheating.

The  $v_{max}$  is the maximum linear speed the actuator can reach without destroying the mechanical system. If the motor of the actuator could turn faster, it needs to be limited.

Diagram 1

CASM-25  
CASM-32/40/63

Electric cylinders with lead or ball screws for loads up to 5,4 kN or speeds up to 1 067 mm/s. These cylinders are equipped with brushless DC motors with integrated electronics or with servo motors for higher performance demands, in inline or parallel configuration.

CASM-100

Electric cylinders with ball and roller screws for an extended range of forces, up to 82 kN and speeds up to 890 mm/s. Several screw sizes, gearboxes and motors can be combined to provide a wide selection of performance levels.

LEMC

Electric cylinders with high performance roller screws for forces up to 80 kN or speeds up to 1 000 mm/s. LEMC cylinders are equipped with smart AC motors with bevel or parallel gearboxes or with servo motors in inline or parallel configuration for very high performance.

SRSA, SVSA, SLSA

For high loads up to 500 kN, Ewellix offers the SRSA range with high performance roller screws and servomotors. For improved positioning accuracy, the SVSA is equipped with a roller screw with 1 mm lead which can handle forces up to 175 kN. The high speed version SLSA has a large pitch screw and reaches speeds up to 1,5 m/s. All are available with inline or parallel motor.

CEMC

Compact electric cylinders CEMC for highest performance among the cylinders listed here? Need to define what group you are considering, but low weight. The fully integrated actuators are equipped with hollow shaft motor and inverted roller screws and are built for loads up to 25 kN. The perfect choice for weight sensitive robot arm applications.

## Linear units

Linear unit	Maximum dynamic axial force $F_{max}$ kN	Maximum linear speed $v_{max}$ mm/s	Dynamic load capacity $C$ kN	Screw type	Screw diameter mm	Ref page
CASM-25	0,3	300	2	Ball screw	8-2,5	61
CASM-32/40/63	5,4	1 067	21	Lead screw/ Ball screw	9-20 10-20	74
CASM-100	82	890	106	Ball screw/ Roller screw	32-40 30	144
LEMC	80	1 000	122	Roller screw	21-30	180
SRSA	500	1 111	572	Roller screw	39-75	236
SVSA	175	10,4	174,2	Roller screw	32-50	244

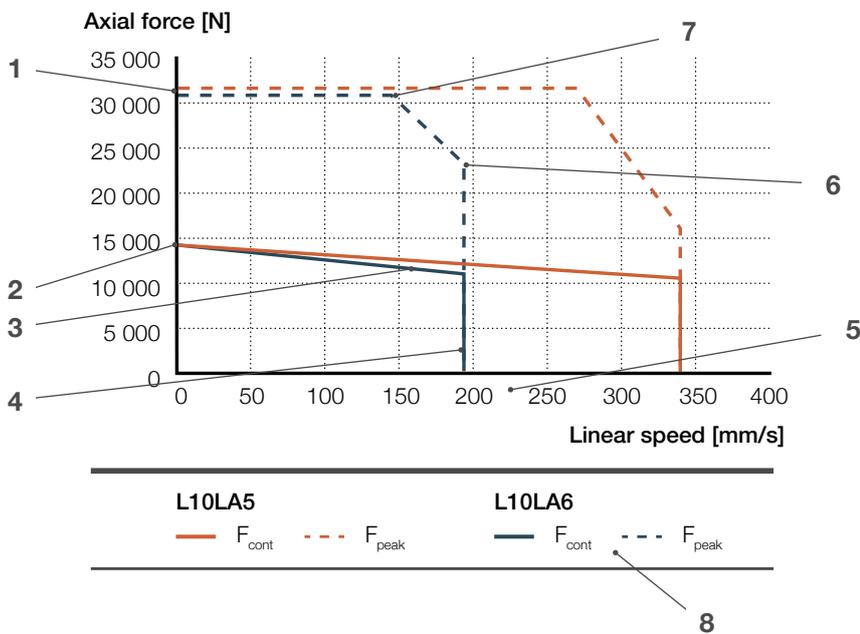

## Actuators

Actuator family	Continuous force @ zero speed $F_{co}$ kN	Peak force @ zero speed $F_{p0}$	Maximum linear speed $V_{max}$ mm/s	Maximum stroke $S_{max}$ mm	Motor type	Ref page
CASM-25	0,3	0,3	125	50	Servo motor	62
CASM-32/40/63	2,4	5,4	1 060	800	BLDC motor/Servo motor	82
CASM-100	25,6	75,5	750	2 000	AC motor/Servo motor	150
LEMC	50,7	69	680	800	AC motor/Servo motor	186
CEMC	18,4	25	300	180	Servo motor on inverted roller screw	220
SRSA	208,1	490	950	1 500	Servo motor	248
SVSA	74,6	174	10	900	Servo motor	264

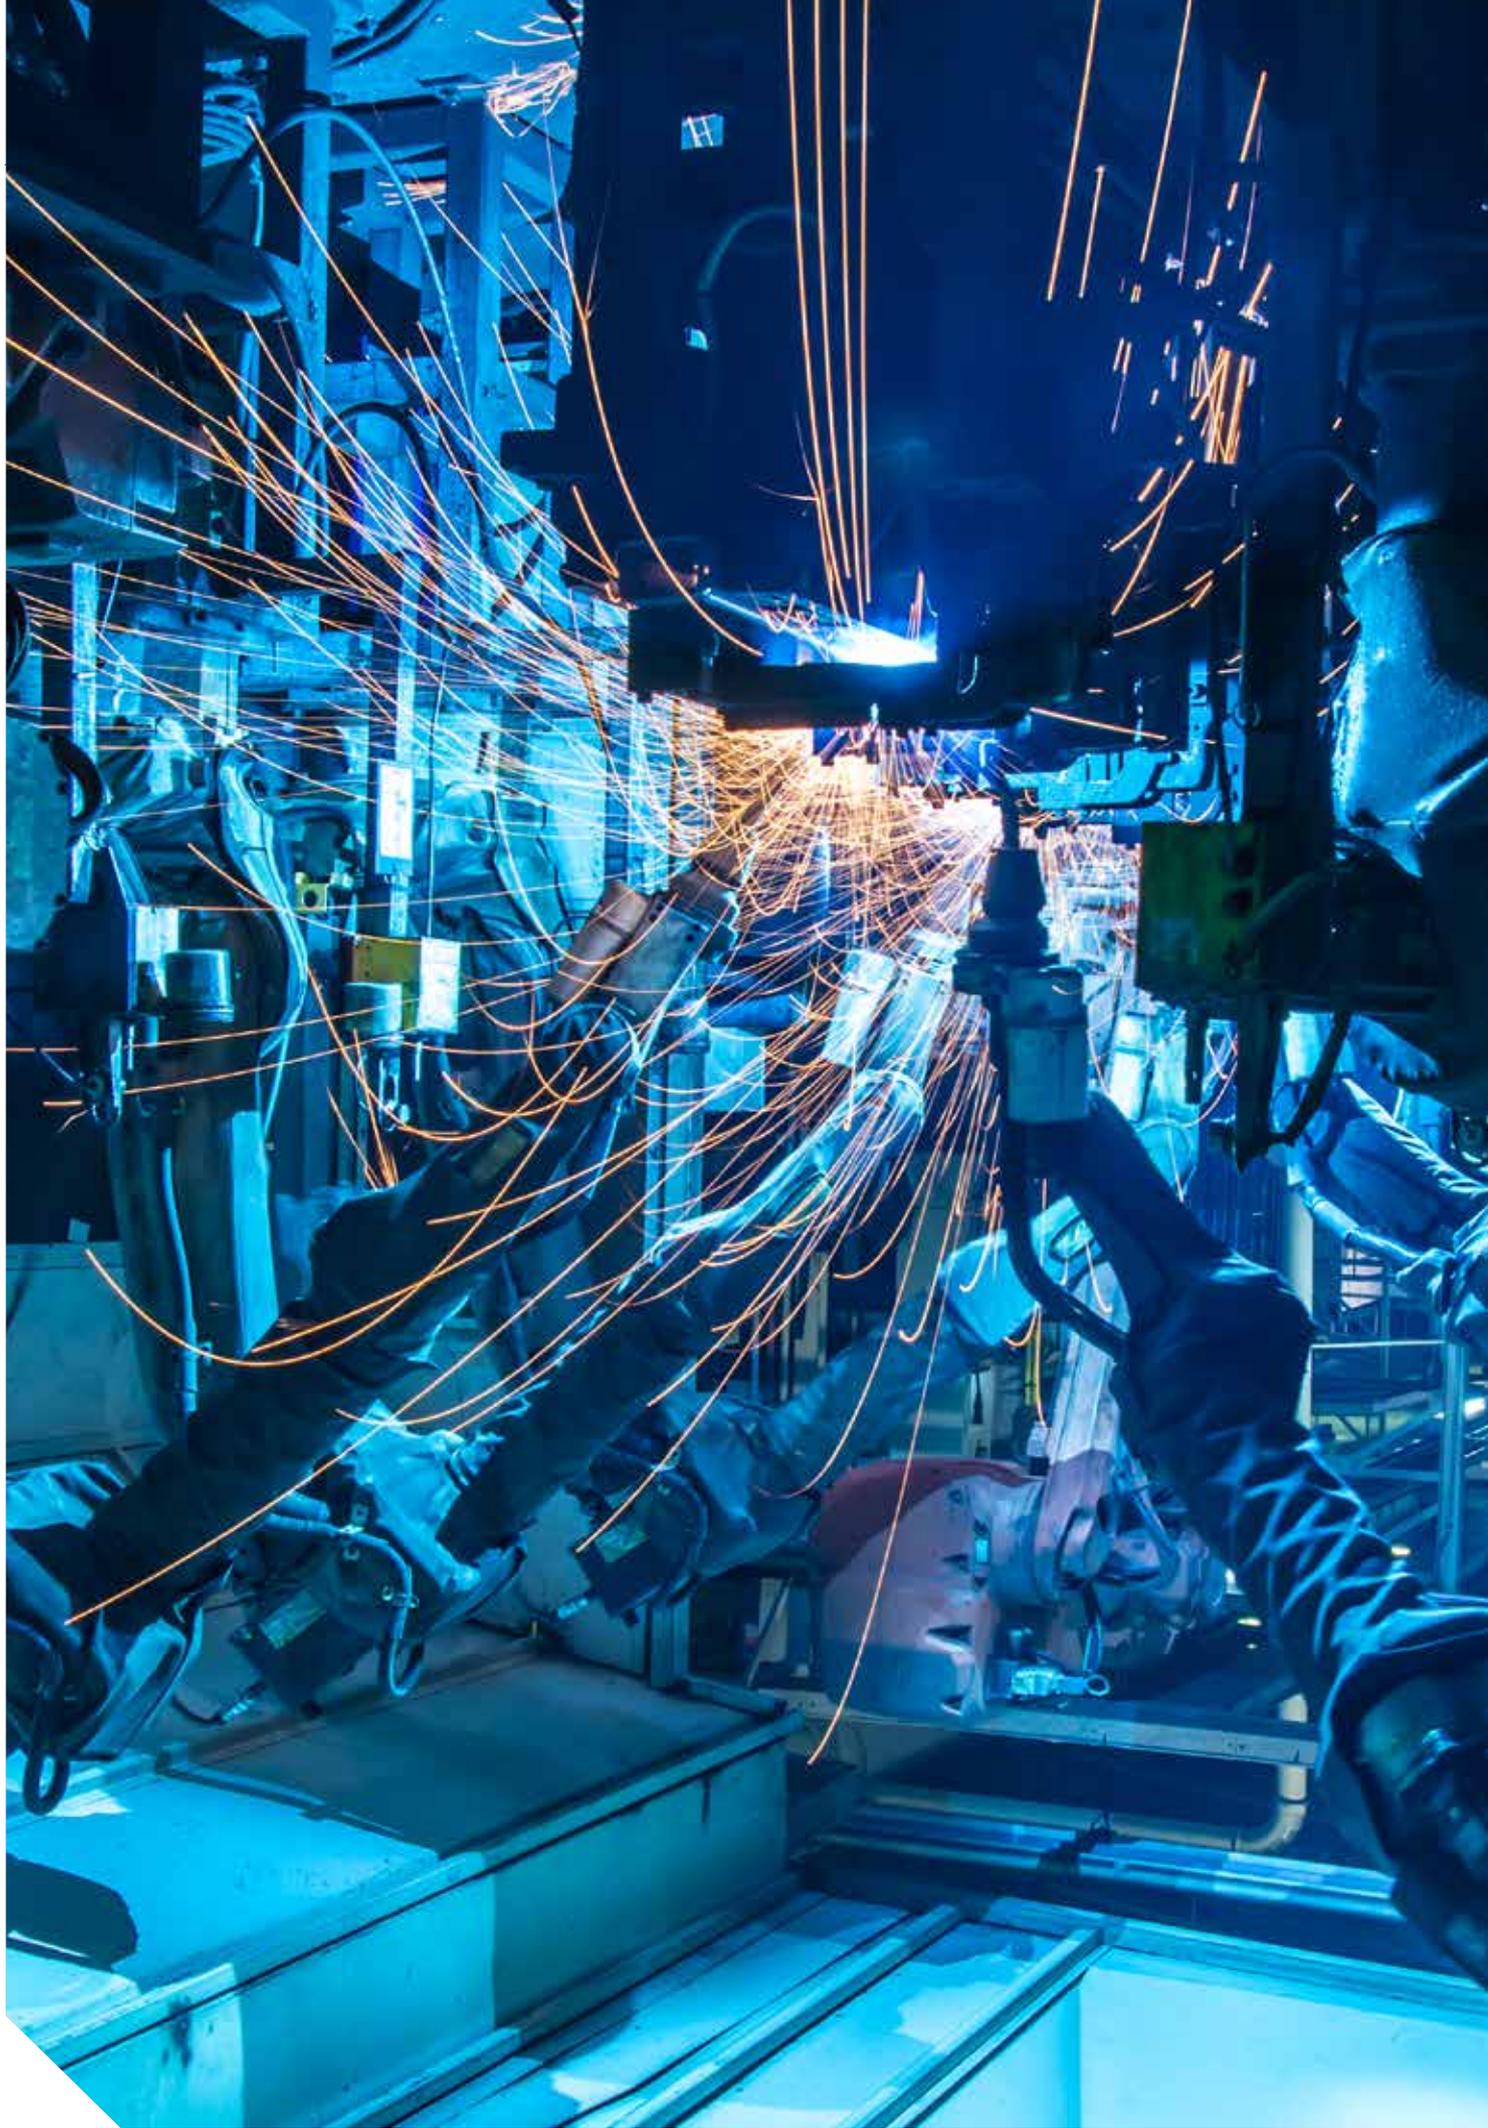

# How to read a performance diagram

Actuators within the product range chapter, a technical description is available for each actuator family. This includes performance overview, a detailed product description and motors and adapters information. In addition to that, each actuator type and size has dedicated tables with the main technical data. In particular the performance of each complete actuator is described through diagrams.

Below is a general description of how to read the axial force / linear speed diagram.

1. Peak force at zero speed. This is typically the highest peak force of a servo motor ( $F_{p0}$ )
2. Continuous force at zero speed. This is typically the highest continuous force of a servo motor ( $F_{c0}$ )
3. The continuous force of a servo actuator is typically decreasing when speed is increasing
4. Continuous force of the servo actuator at maximum speed ( $F_c$ )
5. Maximum speed of the servo actuator
6. Peak force of the servo actuator at maximum speed ( $F_p$ )
7. Maximum speed of the servo actuator at maximum peak force
8. A different colour means the same linear unit but a different motor/ gearbox combination

# Product benefits of electric cylinders over pneumatic and hydraulic cylinders

Linear movements in modern applications place high demand on travel profiles. Pneumatic and hydraulic cylinders quickly reach their system performance limits while Ewellix electric cylinders offer improved performance and simpler setup in applications that were traditionally served by pneumatic and hydraulic cylinders.

## Performance

### Controllability and positioning precision

The compressibility of air provides limitations on the level of control that can be achieved with pneumatic actuators. It's also difficult to provide the slow, controlled speeds that are needed in certain applications. With hydraulics, the situation improves, but to control in multiple positions, still requires a complex servo-hydraulic configuration that increases the cost and setup time of the overall system.

Electromechanical actuators have a direct mechanical link between the motor and the screw that provides complete controllability of the system, with high levels of repeatability, down to the micron level as well as higher stiffness. Moreover, it's very easy to precisely change the speed along the motion cycle. Finally, for electromechanical systems, there is no warm up time, increasing the productivity of the machine (↳ **table 1**).

### Weight

Pneumatic cylinders by themselves are lightweight devices, but if we consider other components like hoses, valves, air filter and so on, the overall system weight increases. The same concept applies to hydraulics.

Electromechanical actuators have a higher weight if just compared to an equivalent fluid power cylinder, but are significantly lighter once the overall system is considered (↳ **table 2**).

Pneumatic

Hydraulic

Electromechanical

Table 1

			
 Positioning precision	Low	Medium	High
 Controlled speed	Difficult	Possible, but complex	Easy
 Warm up time	Needed	Needed	Not needed

Table 2

			
 Cylinder weight	Low	Low	High
 Overall system weight	High	High	Low

### Power density

Pneumatic cylinder force capacity is heavily limited by the maximum pressure (usually up to 10 bars) that can be achieved and by the related energy losses due to air compression. This means that to generate high forces, big cylinder diameters and pressure levels are needed. And forces are usually limited to 30 kN for a size 200 cylinder. Electromechanical cylinders can provide much higher forces compared to a pneumatic cylinder with the same section size, with a power density up to 8 times higher. Hydraulic cylinders can have an even higher power density but they need more installation space in the machine due to tubes and hoses. Electromechanical cylinders just use power cables for operation, requiring a smaller space (↳ **table 3**).

### High speed performance

With pneumatic cylinders, it is easy to reach very high speeds in operation. With hydraulics, a large flow is needed to meet the same goal, but there must be enough pressurized oil in the system to reach the required flow level. For hydraulics an accumulator can do the job by holding the pressurized volume, deploying additional capacity when needed. In any event, this means a more complex and costly hydraulic system setup that can lead to very high power consumption. With electromechanical cylinders, it is easy to match the application needs by selecting the best combination of screw lead and motor rotational speed, which optimizes the power consumption without any added system complexity (↳ **table 4**).

### Reliability and lifetime

Electromechanical actuators have more components than a generic pneumatic or hydraulic cylinder. Thus, such a fluid power system has many more critical parts (compressor, filter/regulator, valves, seals, hoses....etc.). If these components have issues, it will affect the entire system, leading to machine downtime. This fluid power system is also very contamination sensitive and requires efficient filters that need to be serviced over time. With electromechanical systems, the most common points of failure are the screw or the bearings. These components have  $L_{10}$  life ratings, which can be calculated based on the life equations typically found in the Ewellix catalogs. This greatly helps in selecting the correct product sizing, and facilitating predictive maintenance operations. Moreover, electromechanical actuators are less sensitive to contaminants as they do not have a complete circuit constantly under pressure (with several parts subject to wear) (↳ **table 5**).

Table 3

			
 Force	Up to 30 kN	> 500 kN	Up to 500 kN
 Cylinder dimension vs force	1	< 1/8	Up to 1/8
 Installation space	Big	Big	Small

Table 4

			
 High speed	Very Easy	Difficult	Easy
 Power consumption	High	High	Low

Table 5

			
 System complexity	High	High	Low
 Predictive maintenance	Possible	Possible	Easy
 Contamination sensitivity	High	High	Low

# Safety/Environment

## Safety

Hydraulic cylinders usually work with very high pressures (up to 350 bars) and represent a potential hazard for personnel working around the system, due to pinhole leaks and improper couplings. Moreover, if mineral oil is used, there is a potential fire hazard. For pneumatics, the situation improves but the stored energy can still be a danger during maintenance checks or unexpected system shutdowns. It is possible to minimize such risks with these systems by using relief and bleed valves, non-combustible fluid, automatic fire alarm systems and dedicated safety procedures for inspection and maintenance. However, doing so dramatically raises the overall cost and complexity of the system.

Electromechanical actuators do not have fluid under pressure and therefore are safer during operation. By eliminating the motor power, the overall system is de-energized and can more easily be safely managed. By using self-locking actuators or an external fail safe brake, it's also possible to further increase the safety level of the equipment during service (↳ table 6).

## Energy savings

Pressure losses and air compressibility make pneumatics less efficient than other linear motion methods. Hydraulics have better efficiency but still experience several losses in the conversion between pressure generation and linear movement. In both cases, a compressor must run continuously, creating pressure even if there is no movement. Electromechanical systems use energy on demand so they consume close to zero energy while not in use. Their higher efficiency in converting electricity into mechanical power allows them to achieve tangible energy savings in operation (↳ table 7).

## Noise

Pressure pulsation, created by the operation of pumps in a fluid power system, is one of the primary causes of noise issues for this technology. But other components like valves and compressors are also contributing to noise generation. Electromechanical systems are generating noise primarily from the screw movement. Therefore, noise is generated only when the actuator is in use. Moreover, the overall level is usually negligible when compared to a fluid powered system (↳ table 8).

Table 6

			
 Potential hazard	Medium	High	Low
 Safety in operation	Complex	Complex	Very easy

Table 7

			
 Consumption while not in use	Medium	High	Close to zero

Table 8

			
 Cylinder noise level	Medium	Low	Low
 System noise level	Very high	Very high	Null

## Environmental

Air can be contaminated by oil or other impurities, and needs to be filtered to avoid environmental pollution. Also, leakages and disposal of hydraulic oil represent a significant environmental issue and potential source of pollution. The energy losses on the whole system, especially hydraulic, can cause ambient overheating that then has to be evacuated, causing extra energy waste for the cooling system.

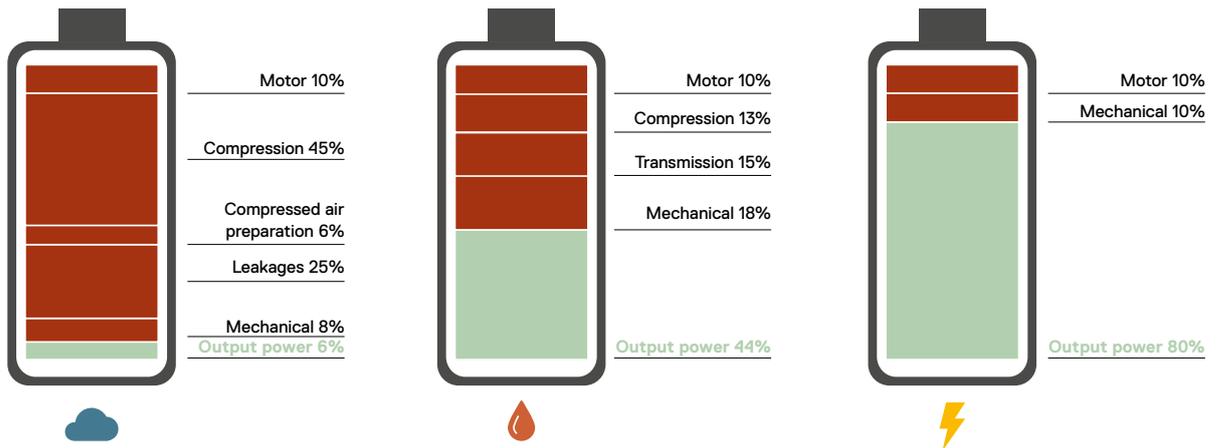

Electromechanical systems use grease as lubricant that is fully contained inside the actuator body. The quantity used is small and doesn't represent a significant source of pollution. Electromechanical actuators also generate heat but at a

negligible level compared to hydraulic, thus being much more efficient (↳ **table 9**).

Table 9

			
 Environmental pollution risk	Medium	High	None
 Heat generation	Medium	High	Low

### Efficiency: Energy losses comparison

# Simplicity

## Installation

Pneumatic systems require many components, including hoses, pumps, valves, regulators, lubricators, and air filters. Hydraulic systems, as well, require a complex setup including a fluid reservoir, pumps, motors, release valves, heat exchangers, along with noise-reduction equipment. This means the commissioning time is long since several parts of the system must be fine-tuned. Electromechanical systems only require a motor, electric cables and, depending on the motor type, a driver. This allows a much smaller system footprint and a simple mechanical layout, reducing significantly the installation and commissioning time of the equipment (↳ table 9).

## Maintenance

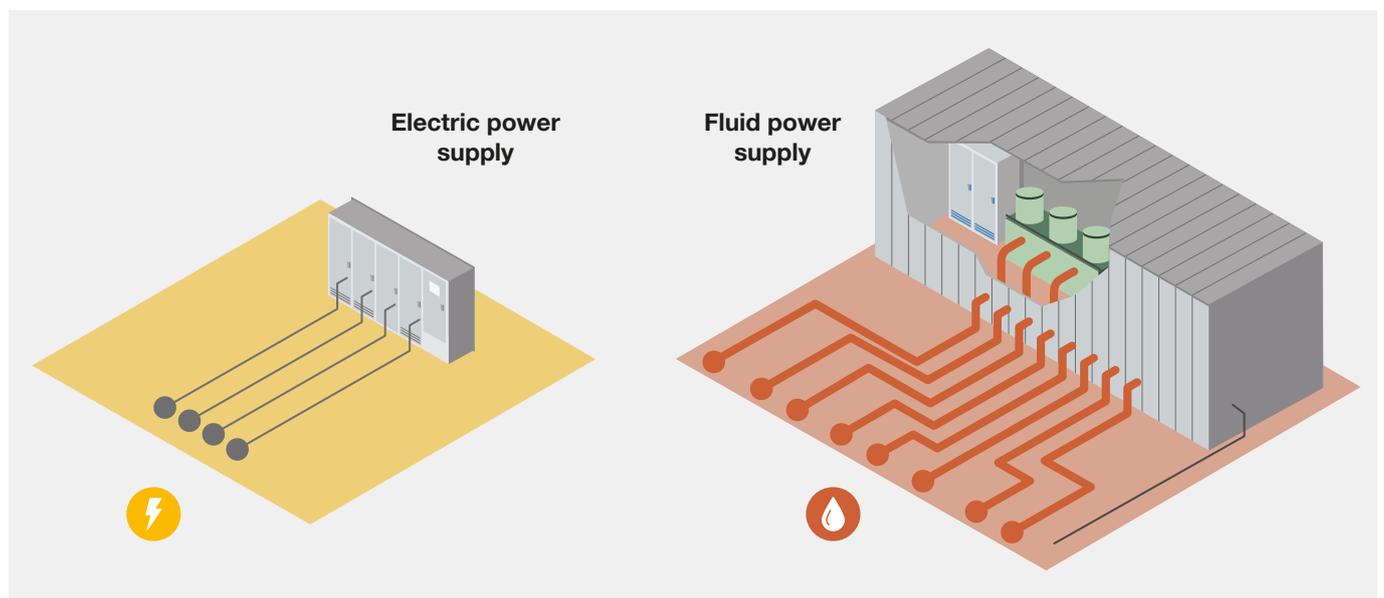

Fluid powered systems require constant maintenance to achieve overall system efficiency, avoiding leaks and failures. The filtering system, valves, pipes and fittings should be monitored and serviced to improve cylinder performance over time. Moreover, manual inspection operations are required to check the system status and spot possible issues. Electromechanical actuators can be operated virtually without maintenance for their whole lifetime or, depending on the working cycle and application, may just require a relubrication operation at defined intervals. It's also possible to perform predictive maintenance strategies thanks to the integrated sensors (like current, displacement, force, acceleration) that allow real-time remote monitoring and that can be and that also can forecast product lifetime in operation (↳ table 10).

Table 9

			
 Footprint	Large	Large	Very small
 System commissioning time	Very long	Very long	Short

Table 10

			
 Maintenance	Constant	Constant	Not required / seldom
 Cost of maintenance	High	High	Very low
 Remote monitoring	Possible	Possible	Easy

### Quicker replacement

Replacing components in a fluid power system requires depressurization, oil disposal (in the case of hydraulics), part substitution and recalibration to get back into operation. This requires a defined amount of time with specialized service personnel. Electromechanical actuators can be quickly replaced by disconnecting the cables and substituting the current actuator with a new one. No further action is required to restart operation (↳ **table 11**).

Table 11

			
 Time of replacement	Long	Long	Very short
 Specialized service personnel	Required	Required	Not necessary
 Maintenance downtime	Longer	Longer	Very short

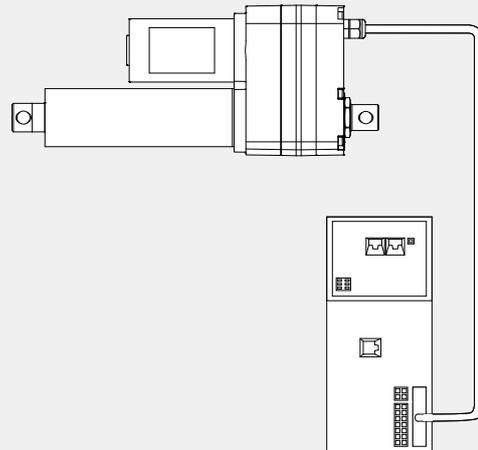

## Design

When designing a fluid powered system, it's important to correctly place the numerous components and to accurately define the right route for the pipes and hoses, creating constraints in the machine layout. Depending on the number of cylinders, the distance between them and the overall machine layout, the design phase can take some time as the designer also has to consider a simple installation and maintenance process. With electromechanical systems, the design process is lean thanks to the use of few components and electric cables only, thus allowing a more flexible routing and installation (↳ **table 12**).

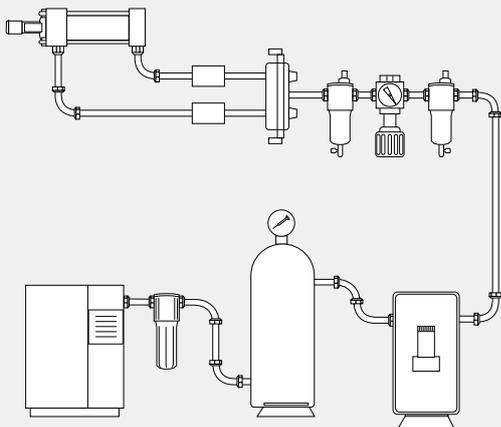

Table 12

			
 <b>Design time</b>	Long	Long	Short
 <b>Project constraints</b>	Significant	Significant	Less

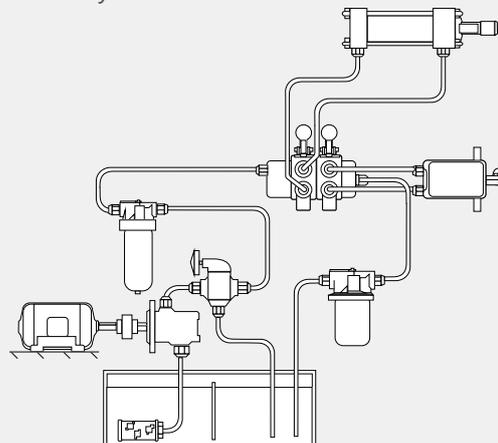

*Electromechanical layout*

*Pneumatic layout*

*Hydraulic layout*

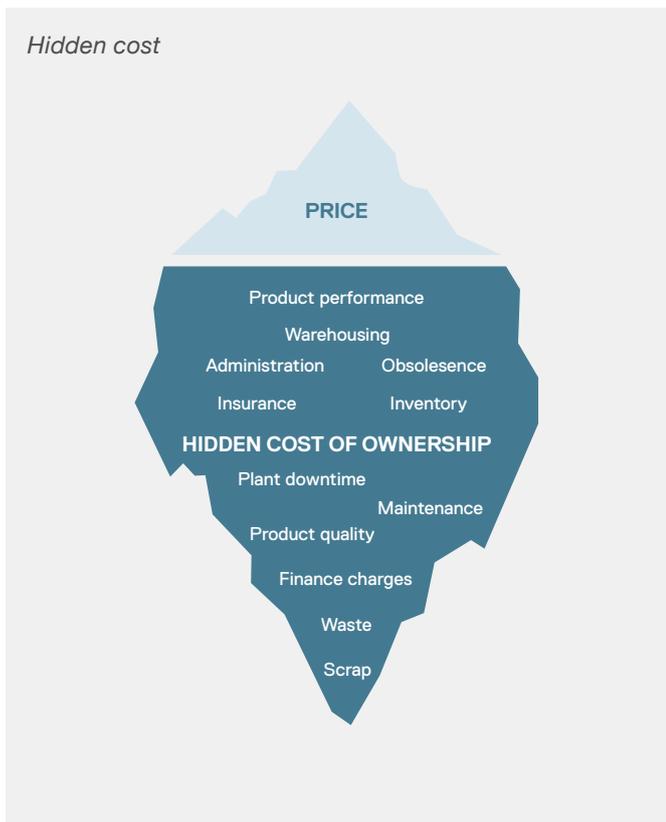

# Total cost of ownership

The evolution in continuous industrial processes is becoming more demanding in terms of motion control performance. The current pneumatics and hydraulics solutions are not competitive in terms of TCO (Total Cost of Ownership) that considers all direct and indirect costs associated with an asset over its entire life cycle. Beside the more obvious performance advantages, there are several others hidden behind the technology or with usual production and factory processes. For example, a higher system efficiency - both in operation or in standby mode - lead to direct savings proportional to the number of cylinders, in monthly and yearly energy expenses. Concerning costs related to machine downtime and maintenance operation, a system with less components, less sensitivity to re-lubrication needs, easier to be serviced and with a quicker replacement time can provide tangible savings in different accounting areas of the factory. Moreover, less components mean less of a need for spare parts and so a lower capital investment in parts. Another hidden cost concerns safety and hazard prevention devices and procedures. A system with an embedded higher safety level can help to reduce the cost of running a safe manufacturing operation. Moreover, removing the oil from some areas of the plant helps to reduce costs related to oil cleaning and disposal.

# Cost saving calculator

Ewellix has developed a tool to support customers in evaluating the cost of running their machinery comparing the use of pneumatic, hydraulic or electromechanical technologies. By inserting some basic information into the tool, the user can get an estimation of the cost savings achievable by switching to mechatronic solutions.

↳ Visit [ewellix/actuator-select](http://ewellix/actuator-select) in the cost saving calculator section to get started

# Customization capabilities

## Ewellix electric cylinder customization

On the standard electric cylinder product range, Ewellix offers an extensive customization program that is able to meet virtually any application need. There are 3 levels of customization that depend on specific requirements and the complexity of implementation.

### Basic customization

These basic design options can be implemented quickly and easily:

- Stroke
- Mounting holes
- Colors
- Attachments
- Motor
- Cables / connectors

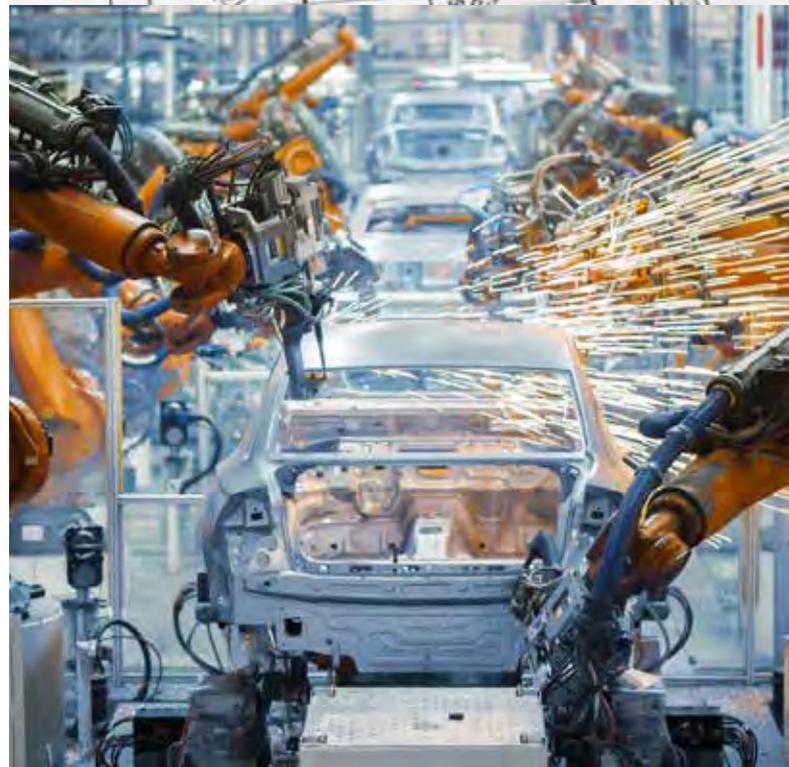

### Advanced customization

These design options are more complex and require a dedicated project by Ewellix personnel working with the customer:

- Materials
- Housing
- Guiding system
- Gearbox (e.g., with hand crank)
- Screw (e.g., lead, treatments)
- Screw Nut (e.g., additional backup nut)
- Painting and surface treatments

### Complete customization

In case the standard actuator offering cannot fully satisfy the technical requirements, Ewellix can offer completely customized solutions that are tailor made for each customer.

## Examples of basic and advanced customizations

### Electric cylinder CASM with spring around the push tube

An electric cylinder CASM (↳ **fig. 1**) has to move a high constant load. To relieve the cylinder's motor and screw from this high load, Ewellix added a spring around the push tube. Most of the constant load is carried by this spring. The motor and the screw are mainly used to accelerate and decelerate the load while moving. This customization increases the cylinder's service life significantly and enables the use of a smaller motor system.

### Electric cylinder CASM made of stainless steel

The electric cylinder CASMS (↳ **fig. 2**) are often used in food and beverage applications. For direct contact with food, Ewellix made a customized version of the CASM in stainless steel, according to the EHEDG Doc 8 guidelines. This cylinder has a rounded, smooth surface with no area for food or bacteria accumulation. The seals are made of H-Ecopur/FDA. The stainless steel cylinder is resistant to food industry chemicals and solvents and is high pressure washable.

### Electric cylinder LEMC with customized attachment

The electric cylinders LEMC (↳ **fig. 3**) are modular in design, which enables quick modifications. In this special case, the LEMC is equipped with a customized trunnion flange to perfectly fit into the customer's application.

### Electric cylinder CASM for harsh environments and low temperatures

Electric cylinders CASM are built and tested for IP54S applications (↳ **fig. 4**). To operate CASM in wet and dusty environments, they are prepared to connect a pneumatic hose. With the hoses open end in a dry place, the CASM can breathe dry air during operation. This eliminates the under pressure while extending the push tube and prevents the entry of dust and humidity into the cylinder. In applications with low temperatures (↳ **fig. 5**), the standard grease of electric cylinders starts to thicken and the lubrication effect is reduced. With a special low temperature grease, this thickening can be eliminated and the cylinders can run smoothly even in very cold environments.

Fig. 1

Fig. 2

Fig. 3

Fig. 4

Fig. 5

**Examples of complete customizations**

**Electric cylinder with very long stroke length (3 100 mm)**

An application on water gates (↳ **fig. 6**) in a hydro power station in Sweden required the replacement a hydraulic cylinder to get rid of the oli leakage risk and improve the uptime in the field.

The solution (↳ **fig. 7**) developed has achieved the long stroke (3 100 mm) and high load requirements, ensuring a reliable operation in a harsh environment.

**Electric cylinder for parallel running**

The application (↳ **fig. 8**) required high accuracy, high stiffness, special environmental demands and a load capacity up to 160 kN. The design ended up in a parallel system with customized gear boxes, robust sealing solution, roller screws, servo motor and redundant brake system.

**Electric cylinder for height adjustment on working platform**

The requirements were to find an electromechanical solution that had a stroke of 300 mm, max load capacity of 70 kN and a maximum weight of 50 kg. The design solution (↳ **fig. 9**) was an actuator with a roller screw, planetary gear and an ultra-compact servo motor. This solution provided a dynamic load capacity of 72 kN, a total weight of 42 kg and a design adapted for harsh environment.

**Electric cylinder adjusting airflow into combustion chamber for a gas turbine**

The function “Inlet Guide Vane” (IGV) for a gas turbine was previously operated by a hydraulic cylinder. But higher demands on controllability and safety required an electromechanical servo solution, specifically designed for that equipment. The solution (↳ **fig. 10**) also included, besides the electric cylinder, a customized Factory Acceptance Test (FAT) and specific documentation package delivered with each product.

Fig. 6

Fig. 7

Fig. 8

Fig. 9

Fig. 10

Fig. 11

### High speed cylinder for testing equipment

Hexapods and simulators are highly demanding in speed level and dynamic. The Ewellix SxSA can be customized and equipped with a long lead ball screw (with 25 up to 50 mm pitch) to fulfill high speed needs up to 1.6 m/s. Benefit is to use same actuator body than the roller screw range of SxSA, for a modularity approach.

Hexapods shown (→ fig. 11) were designed to simulate in a lab the sea wave kinematic for testing purpose of tanks used on boats.

### Electric cylinder LEMC with recirculating roller screw

The modular LEMC actuators might be customized with different types of screws to satisfy specific performance requirements (→ fig. 12).

On a test rig application for material resistance and deformation analysis, it was required to achieve high stiffness and high movement resolution in terms of small linear displacement per motor turn.

By using Ewellix preloaded recirculating roller screw PVU 32 × 1 coupled with a planetary gearbox, it was possible to obtain high pressing forces, high positioning precision and controllability to easily handle micrometric displacements in the application.

### Telescopic electric cylinder

For the steel industry segment, to fit into space availability and required output power, Ewellix has designed telescopic ball screw actuators used to adjust mould and bloom size on continuous casting (→ fig. 13). Two ball screws coupled with worm gears are used to realize the movement while a stainless steel body and special sealing material are protecting the actuator from the harsh working environment (high temperatures, steel particles...). The telescopic design enables a longer stroke for the same retracted length, so that a wider product range can be manufactured using the existing casting line. By improving the mould displacement controllability, telescopic actuators also make it possible to increase the slab quality.

### Extreme power SRSA electric cylinder

For a heavy steel application, Ewellix has realized a customized SRSA cylinder with cutting edge performance to replace hydraulics (→ fig. 14), boosted actuator dynamic capacity (+25%) thanks to a special bearing arrangement and ultra power roller screw size 75 with increased load capacity, long stroke (1 700 mm) and integrated torque limiter between motor and actuator. Moreover, an integrated Profibus absolute multi-turn encoder is mounted on a roller screw to identify actuator position even if the torque limiter has been activated. The actuator is capable of moving up to 110 kN with its 30 kW asynchronous motor and has an overall weight of 1,3 tons and a length of 6 meters in a fully extended position.

# Application examples

## Material handling – Conveyor systems

The high controllability, constant force and accurate positioning capabilities of electric cylinders make them an ideal choice for diverting and sorting applications on conveyor lines.

Conveyor lines are often distributed over a larger area. Bus communication of the electric cylinders simplify the wiring and is also perfectly suited to visualize and control the full system over a larger distance.

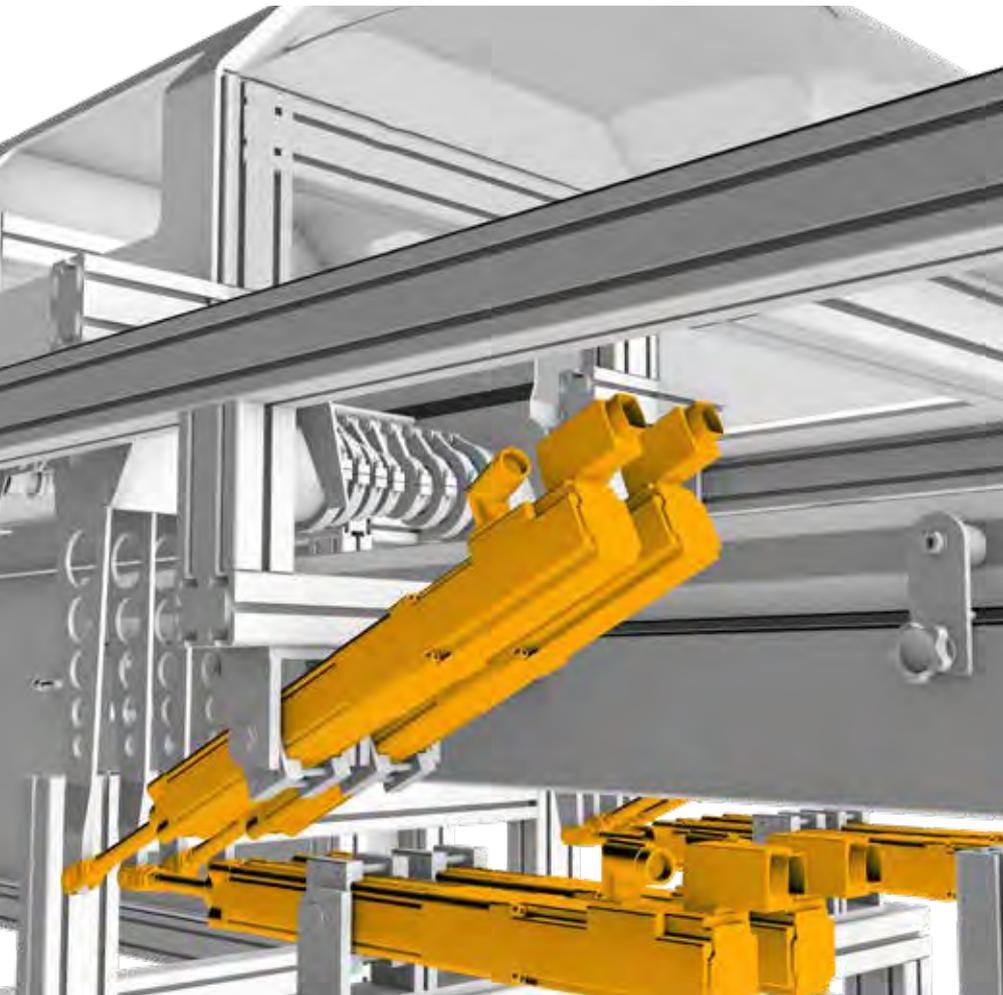

## Food and beverage – Slicing of meat

The high controllability and accurate positioning of electric cylinders enables fast knife adjustments and extreme precision in meat slicing machines.

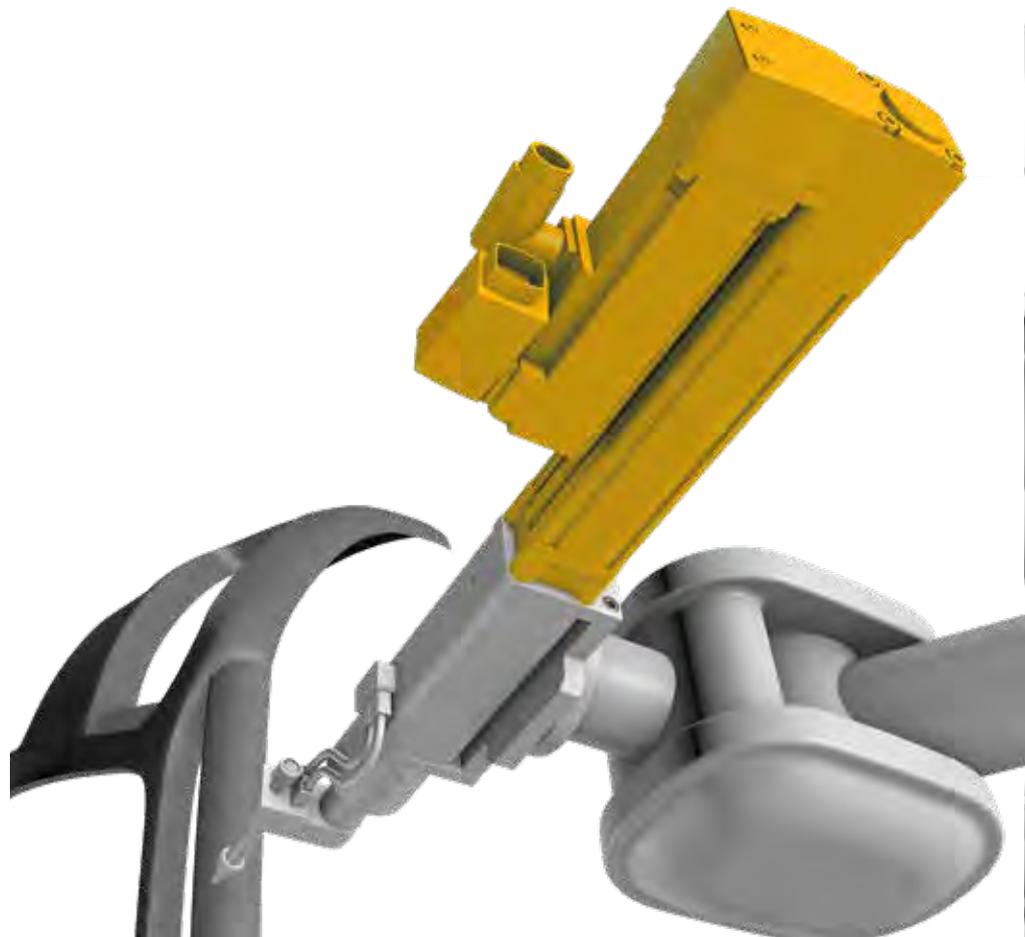

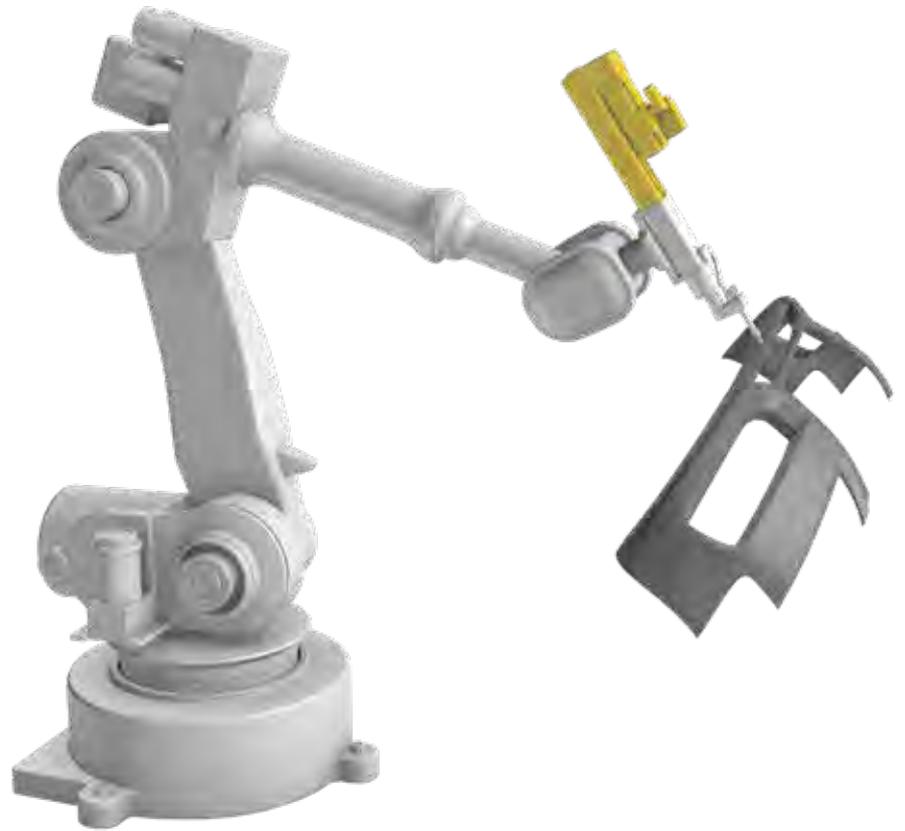

Fully automated cutting machines individually measure the meat and cut it. Quick adjustments of the knives enable users to increase the speed of the conveyor and therefore the productivity of the cutting line with improved continuity.

## Material joining equipment – Gluing machines

Gluing robots with electric cylinders deliver a constant amount of glue which can be adjusted relative to the speed of the robot arm and the viscosity of the glue.

Gluing robots are used in many industries from sinks and windows to machine and automobile parts. Gluing robots help to reduce the cycle time and improve the quality of the products. You can help to ensure consistent quality, optimize operation time and reduce production cost by using electric cylinders in dosage applications.

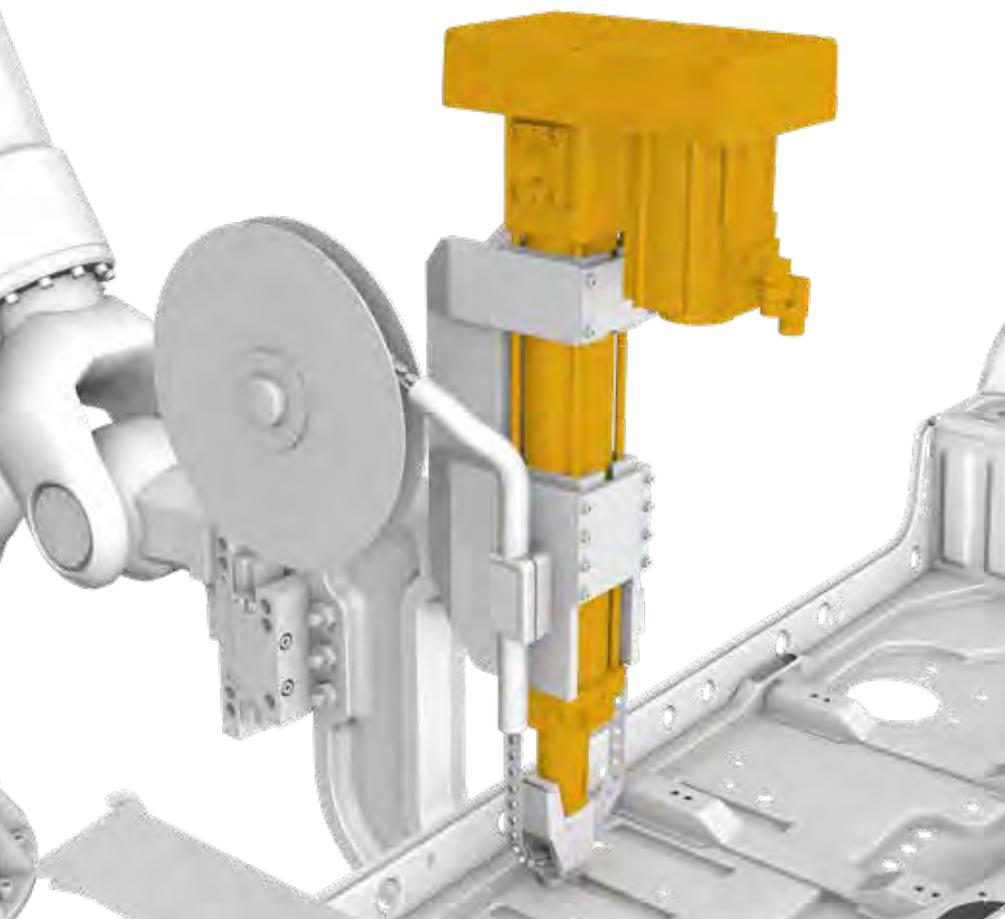

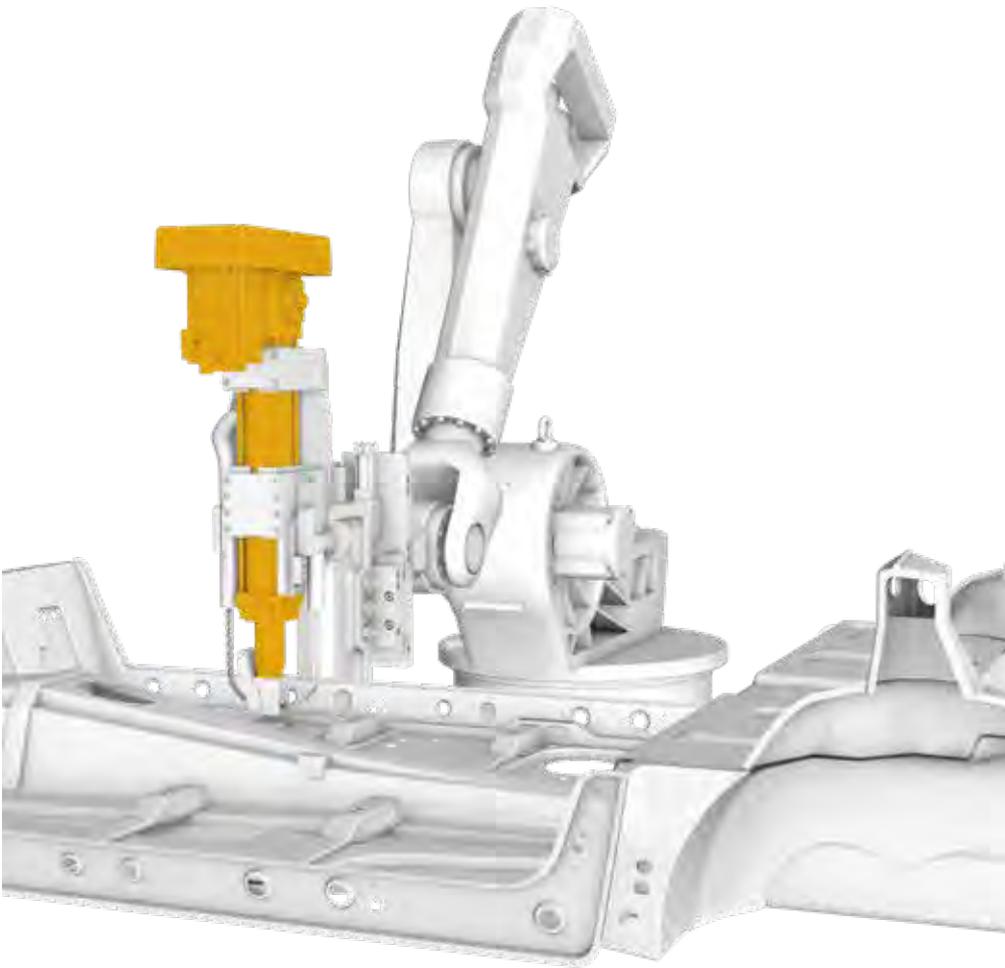

## Material joining equipment – Riveting

Electric cylinders deliver continuous high quality rivets, enabling the use of fewer rivets with no compromise in strength, thereby boosting production line output.

The integrated roller screw technology increases the riveting speed and therefore productivity. The compact light-weight actuator is ideally suited for robot operated technology.

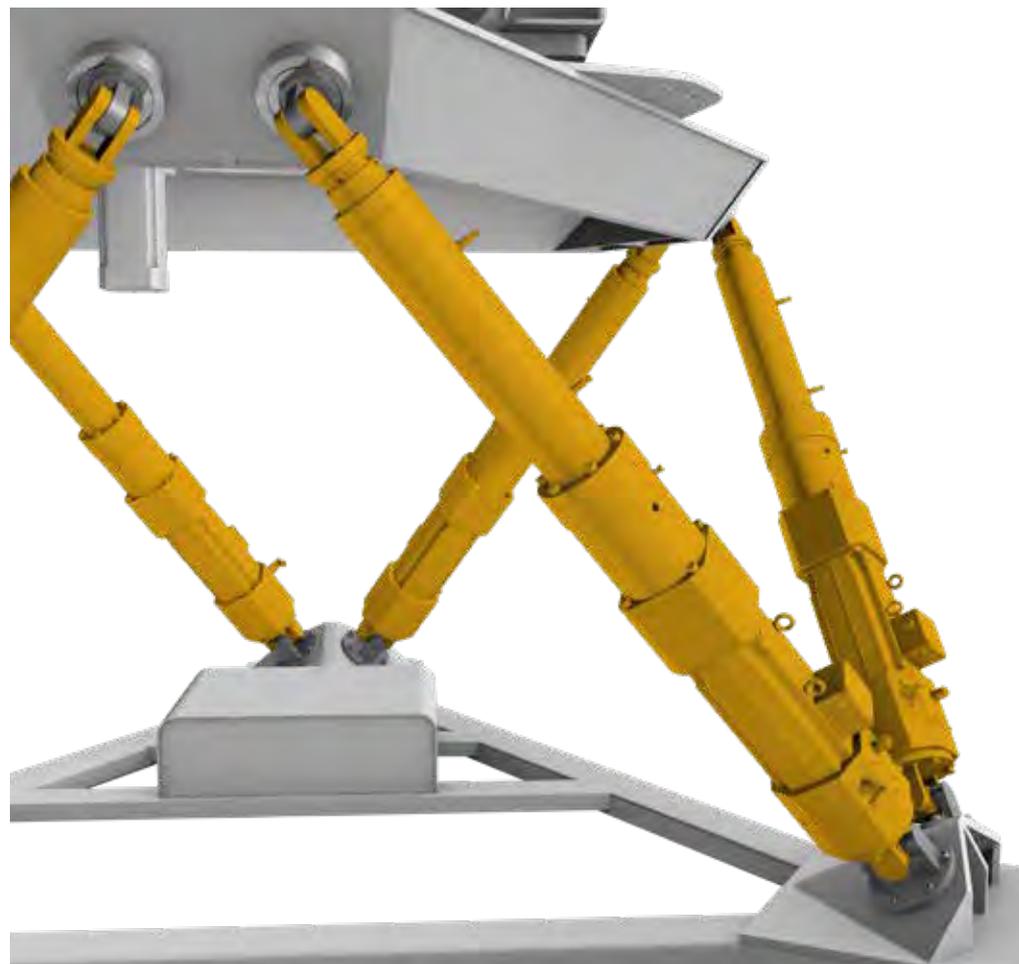

In addition, electric cylinders are highly dynamic and very efficient which saves a lot of energy and operating cost.

## Testing equipment – Bench or simulator

Testing benches require a high level of flexibility to perform different tests, a high level of repeatability to eliminate noise in measurements, and a long service life to survive the equipment being tested. Electric cylinders meet all of these requirements while delivering cost saving energy efficiency.

Depending on the selected type of electric cylinders, testing benches or hexapods can be highly dynamic or ultra-stiff with very high precision. In any case, they offer excellent feedback and real time control.

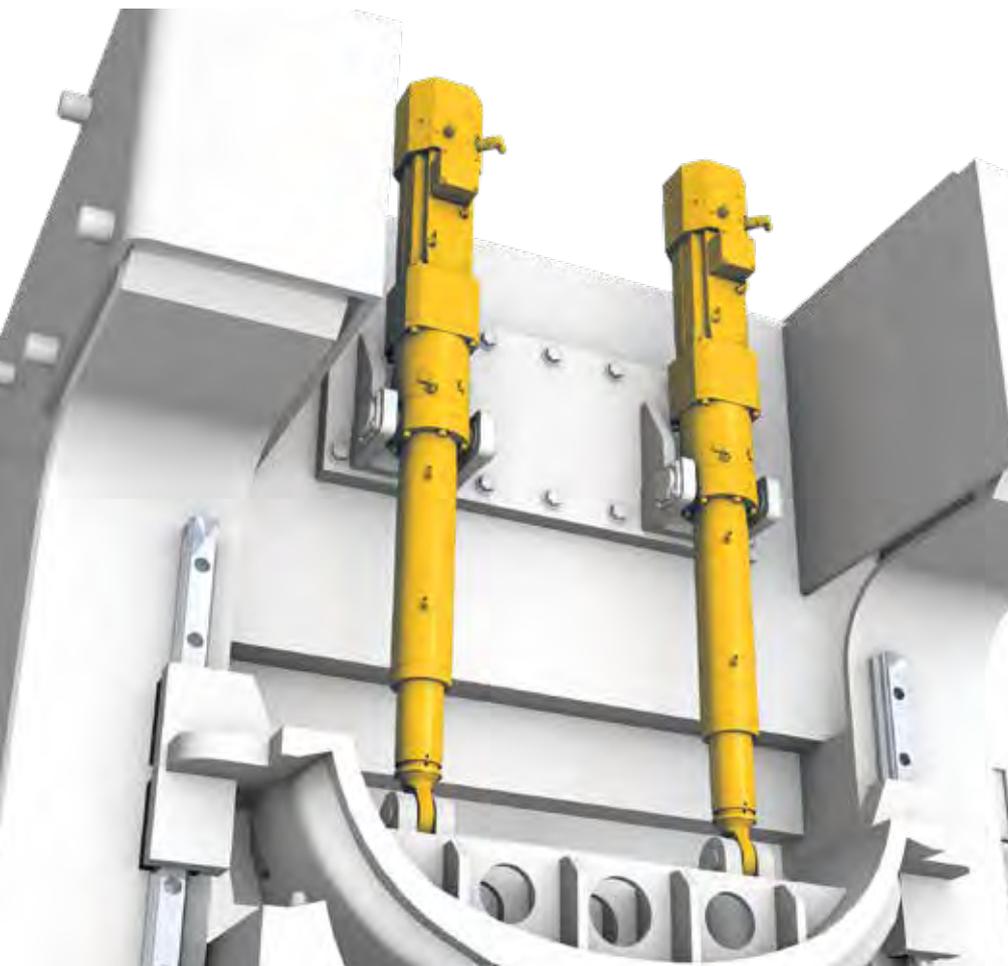

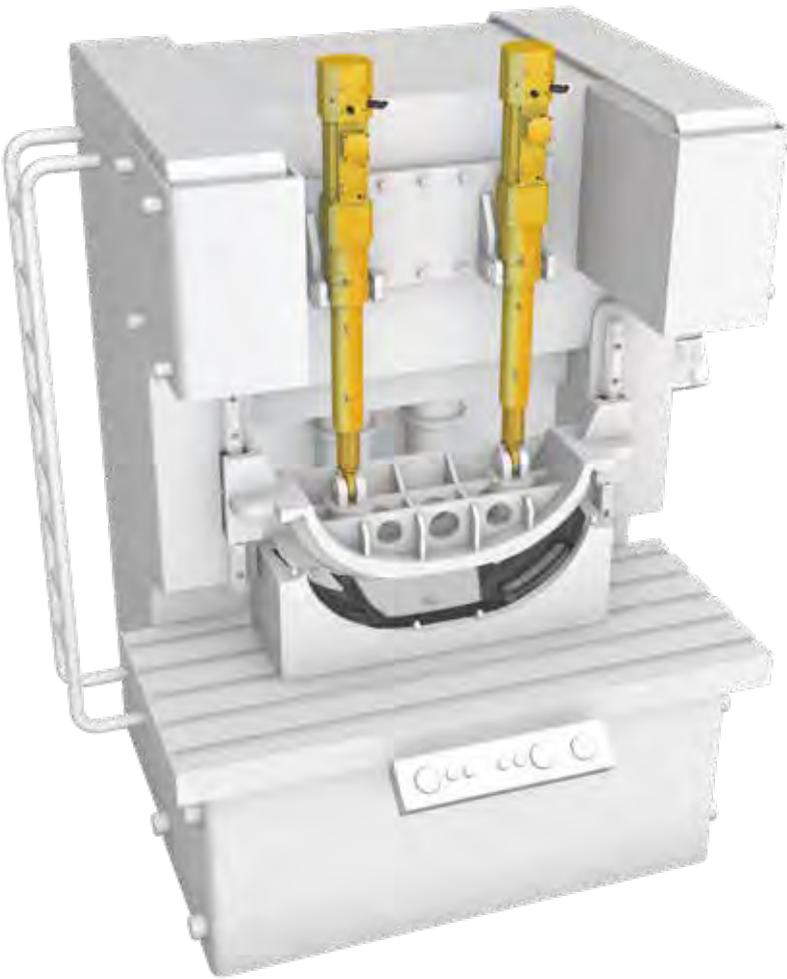

## Electric press systems

1

Thanks to the high controllability of their speed and force, electric cylinders can increase the quality and productivity of pressing and fitting equipment.

Electric press systems are programmable for different workpieces. They are running fully electric and cleanly and are highly energy efficient. The permanent position feedback enables for in-process verification and monitoring, which results in continuous quality on a high level.

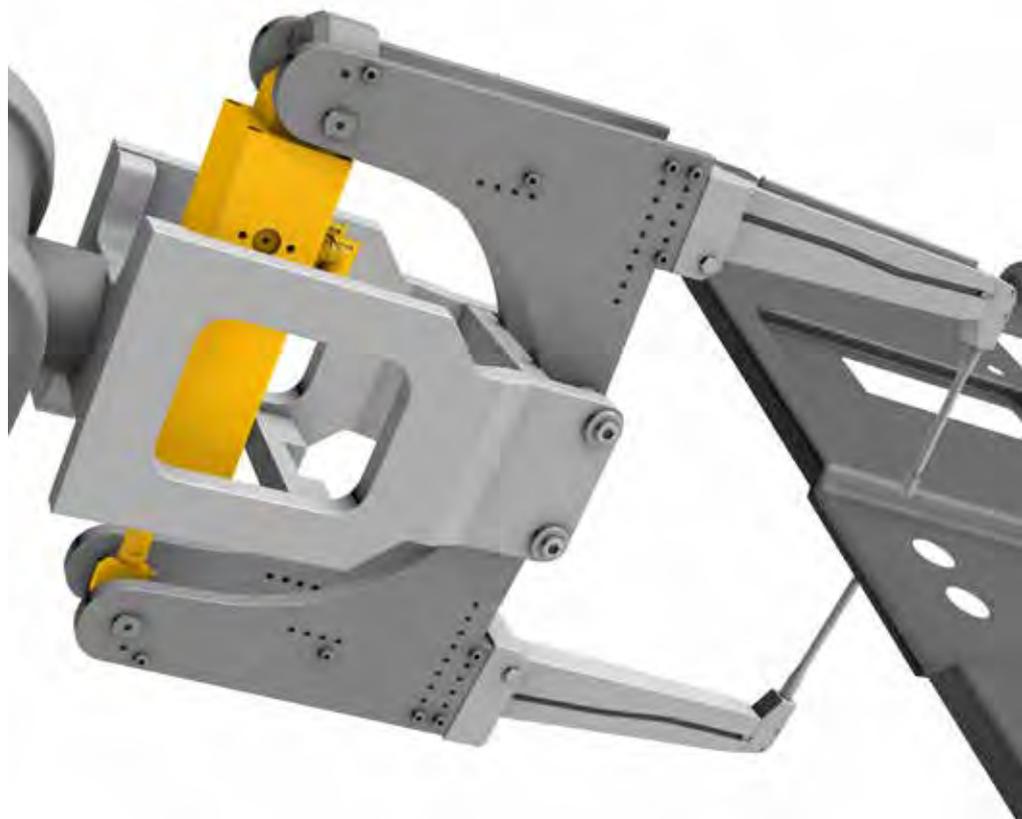

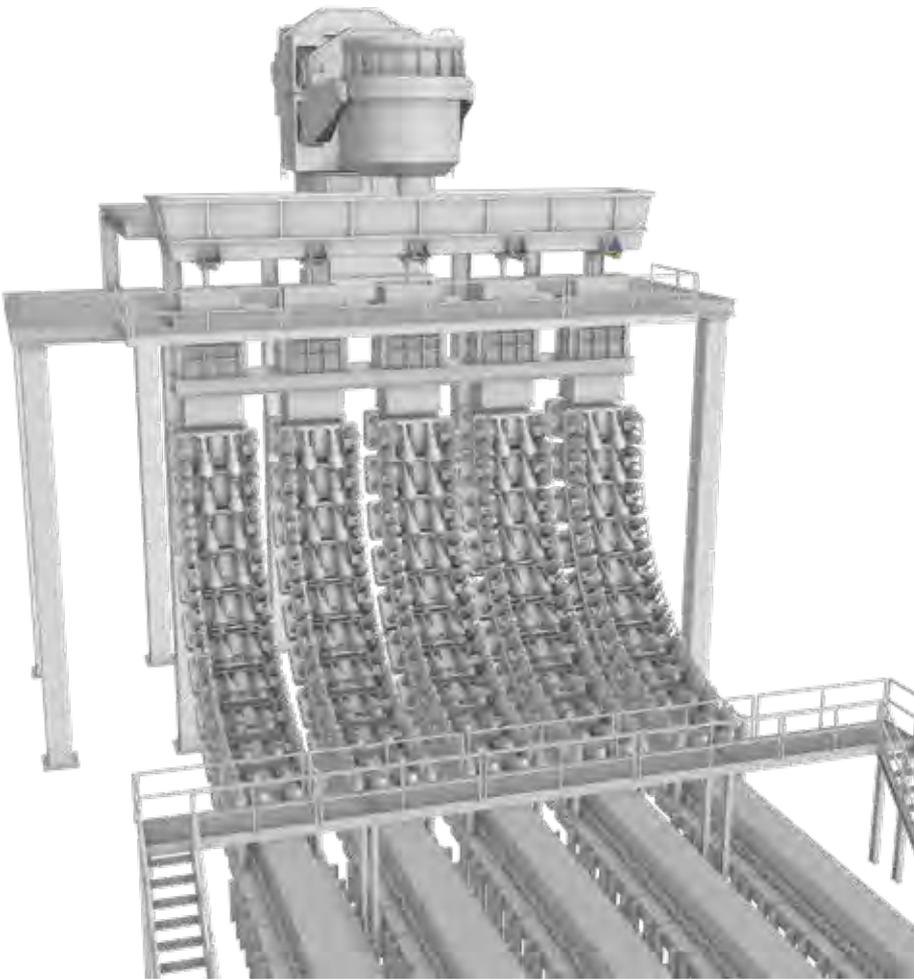

## Material joining equipment – Spot welding

Spot welding guns with electric cylinders enable high quality welding spots with constant force while the wear of the electrodes is equalized.

Low weight is a key feature of the compact, fully integrated electric cylinder which allows fast movement of the robot arm.

Reduced production downtime and less wasted material are some of the many advantages of a spot welding gun equipped with electric cylinders.

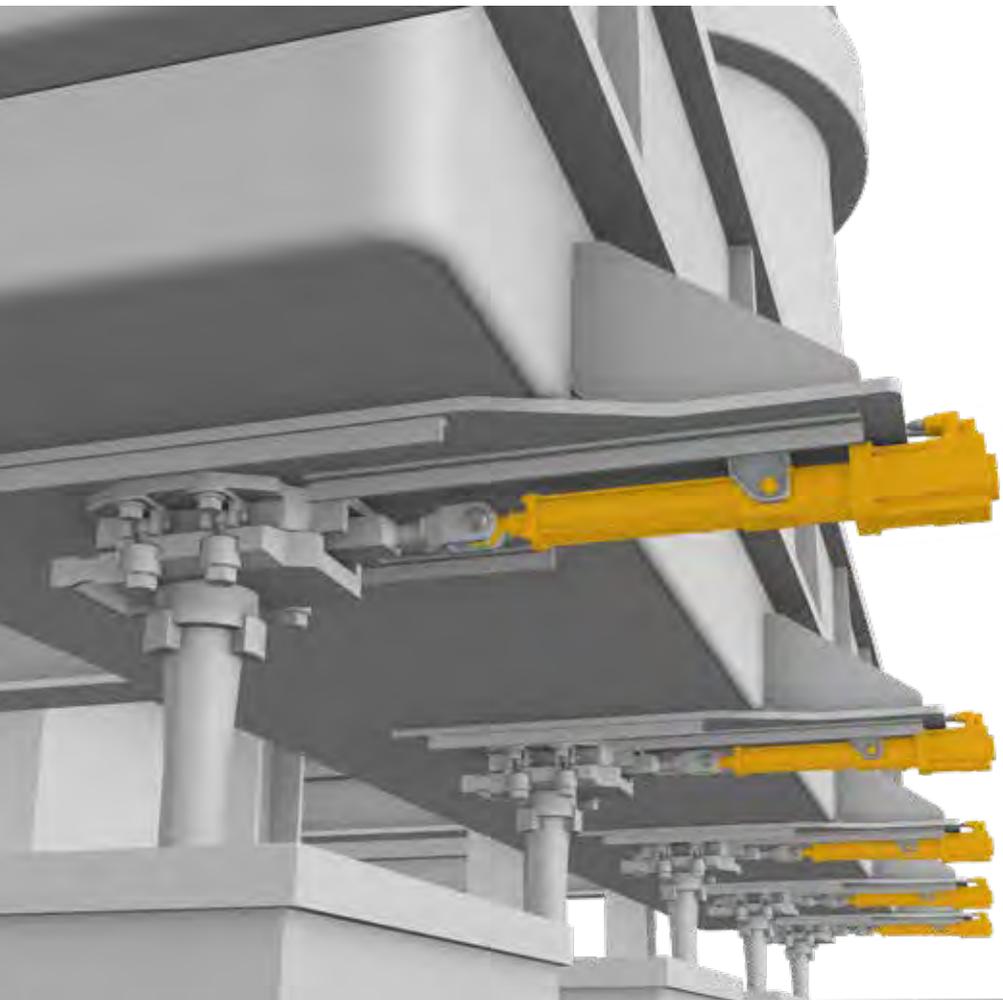

## Heavy industry – Continuous casting of metals

Accurate positioning and high force capabilities make electric cylinders the perfect choice to regulate the flow of melted metals in continuous casting equipment.

Electric cylinders are robust and withstand the harsh environment in heavy industry applications.

Reliable products are very important as downtime in metal casting applications can be extremely costly. Electric cylinders offer permanent feedback and can also indicate if maintenance is needed.

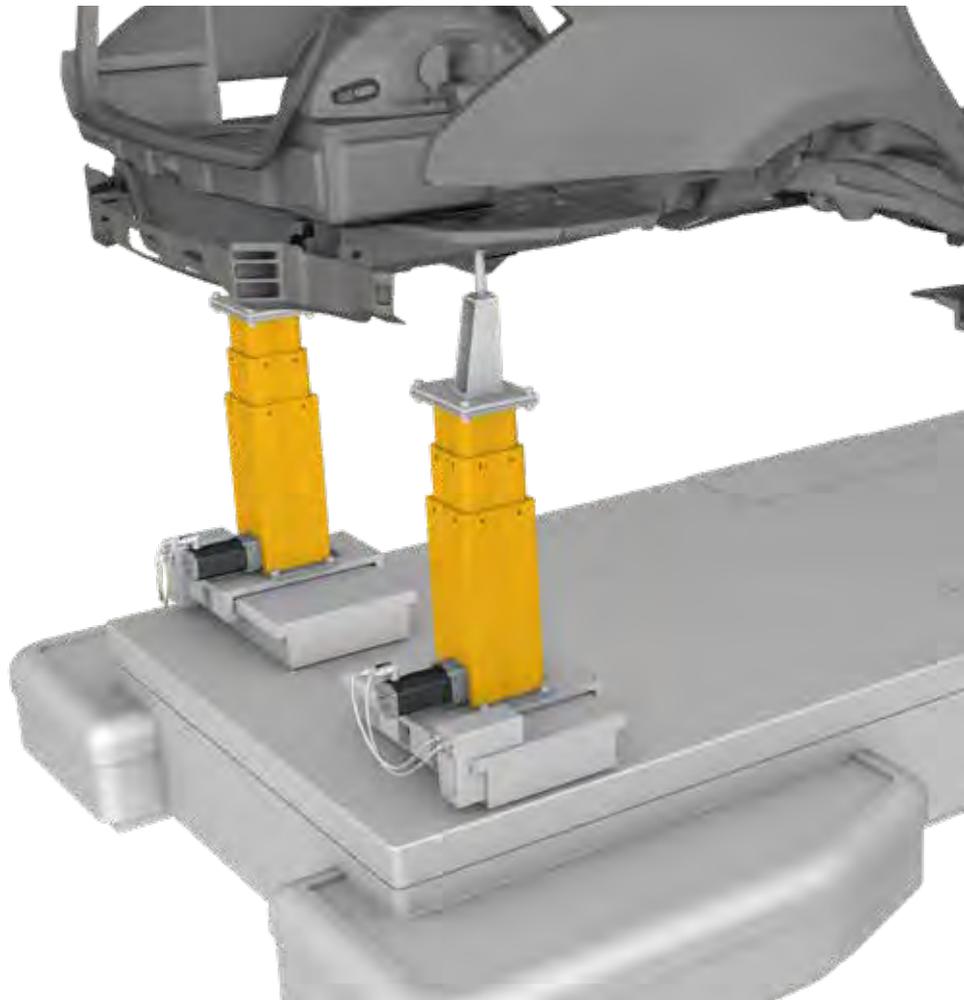

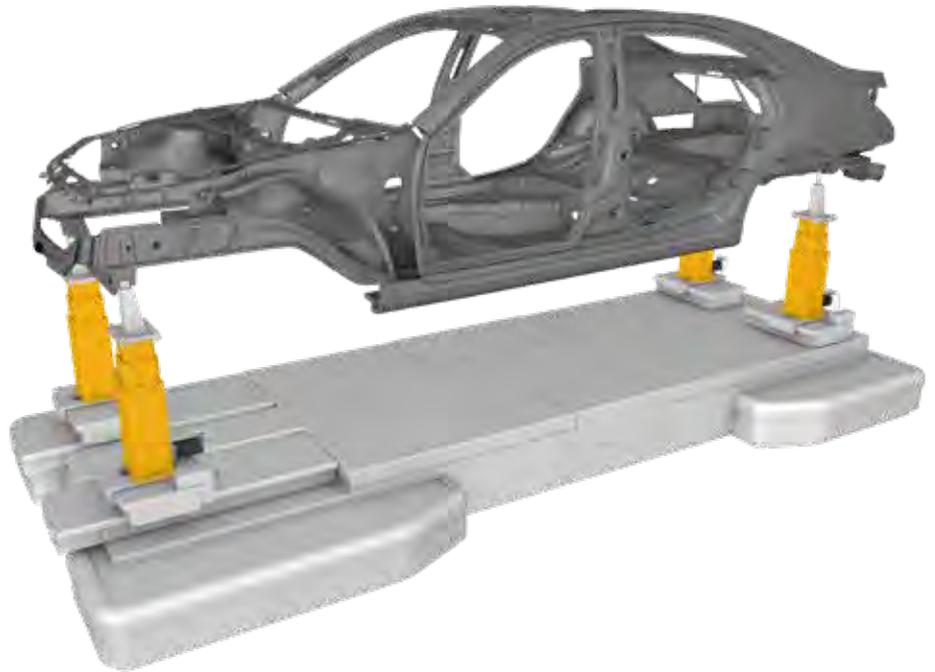

## Factory automation – Automotive

The high controllability and robust construction make a CPSM pillar the ideal solution for realizing a smart chassis levelling function in automotive car transfer units.

The need of handling different types of car chassis on the same line requires a flexible system setup that allows a quick resetting with precise positioning.

The optional integrated dampening system protects the pillar from mechanical shocks during the loading and unloading phases, ensuring high reliability and longer lifetime in operation.

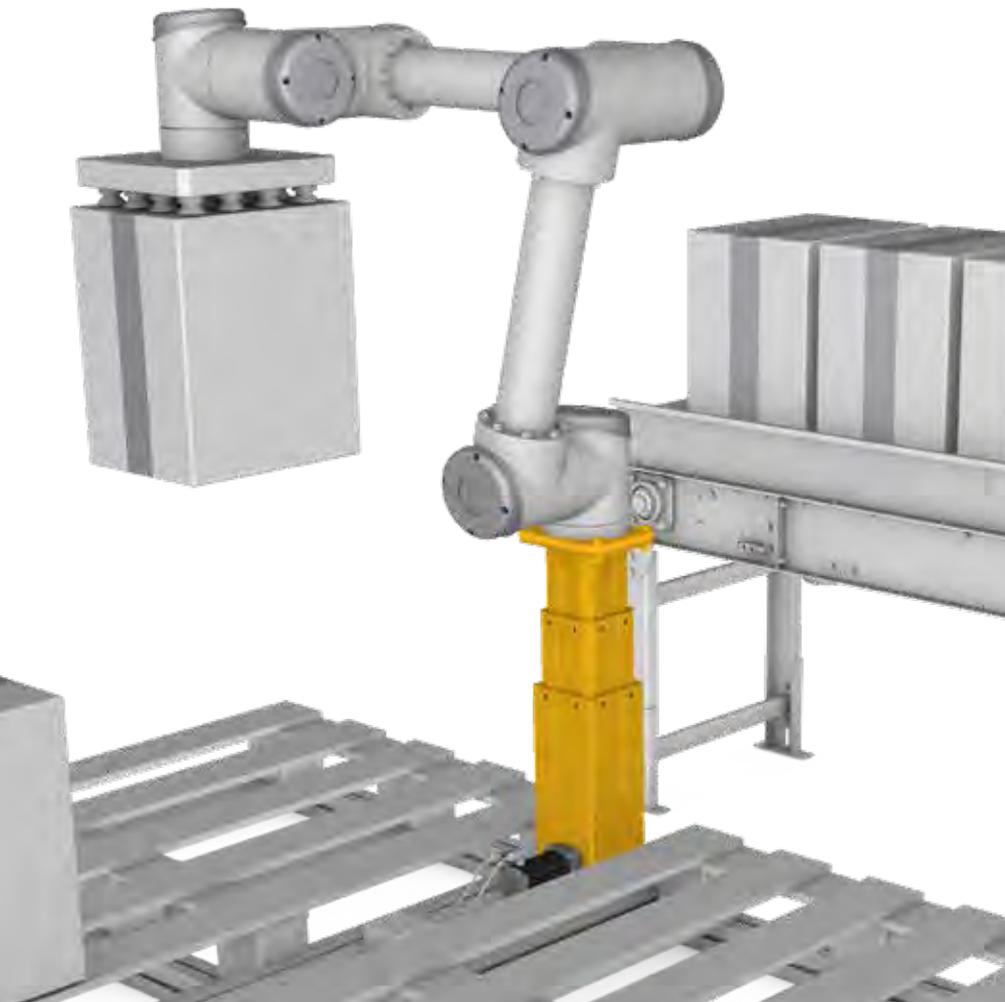

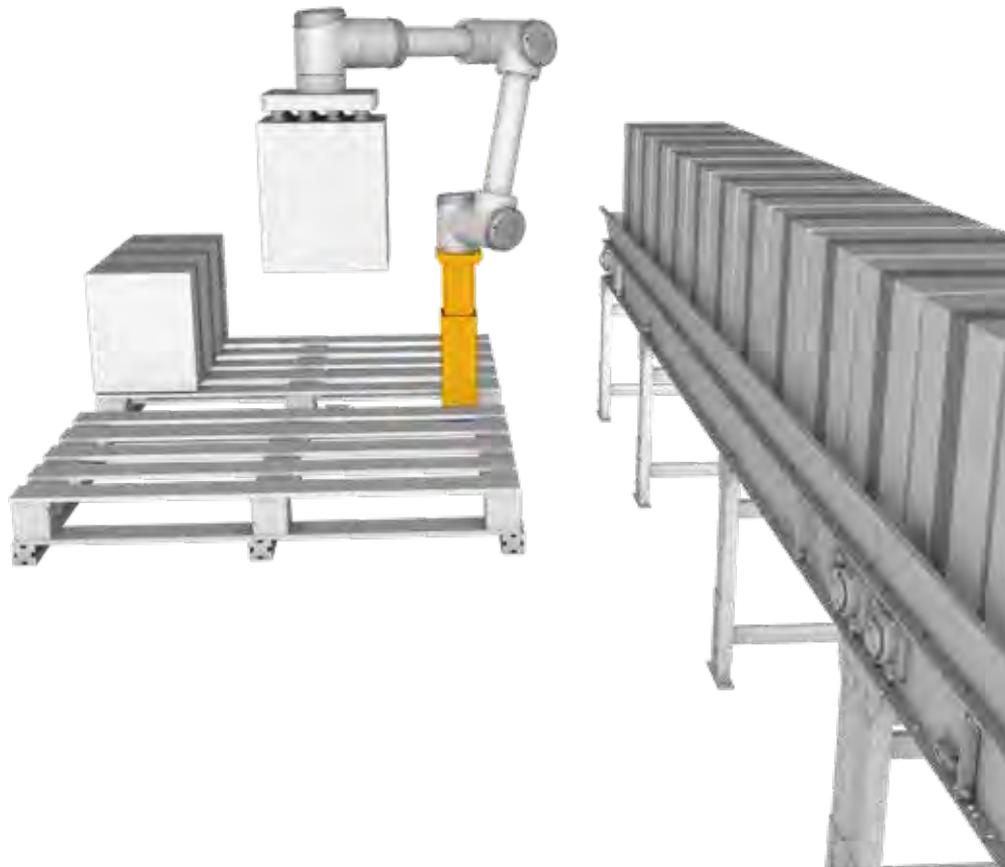

The usage of customer-defined servo motors allows for easier integration into the control network, reducing the commissioning time of the transfer unit.

## Packaging – Pick and place

Fully automated pick and place solutions are becoming a new standard with packaging stations. The main challenge for packaging system manufacturers is to complete multiaxis systems in a simple and cost effective way, while still delivering the required performance.

CPSM servo pillars represent an effective solution to complete vertical axis regulation, thanks to its ability to move heavy excentric loads with a high duty cycle operation.

## Factory automation - Small presses

Small vertical presses require a high level of flexibility and precise control of the force applied and position of the press head. SEMC actuators can surpass the limit of pneumatic and small hydraulic cylinders typically used in this application by delivering higher performances from the integrated roller screw technology and servomotor controllability.

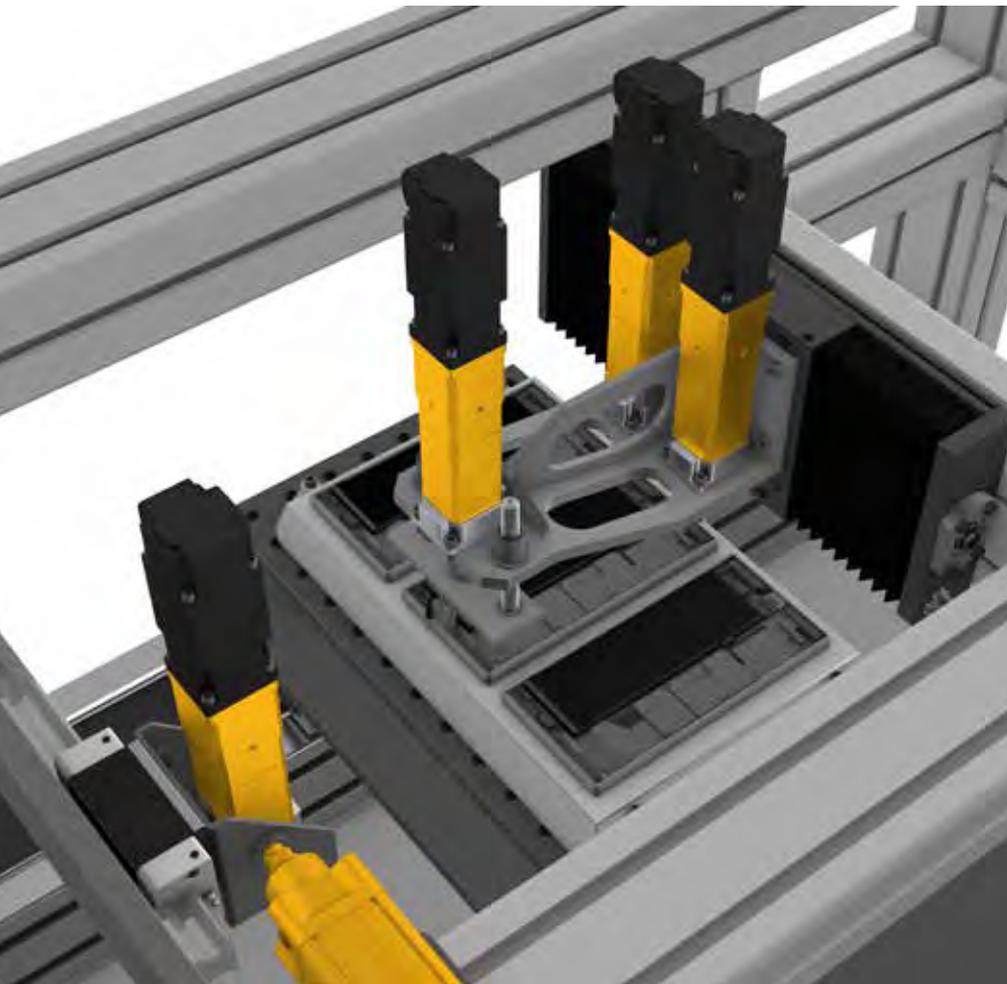

If you have small dimensions, this solution allows easy retrofit during machine refurbishment, keeping the same mechanical installation layout.

## Factory automation – Electronics assembly lines

Electronic products like smartphones or monitors are built in fully automated lines. The complexity of the product requires a reliable process to grant a constant quality of the final product, across the different assembly operations.

CASM-25 electric cylinders can be used to automatize horizontal or vertical axis on quality inspection stations, normally used in processes like smartphones camera or speaker quality checks. Thanks to their small dimension and precise positioning, they can effectively be used as plug and play positioning capability solutions.

# System set-up

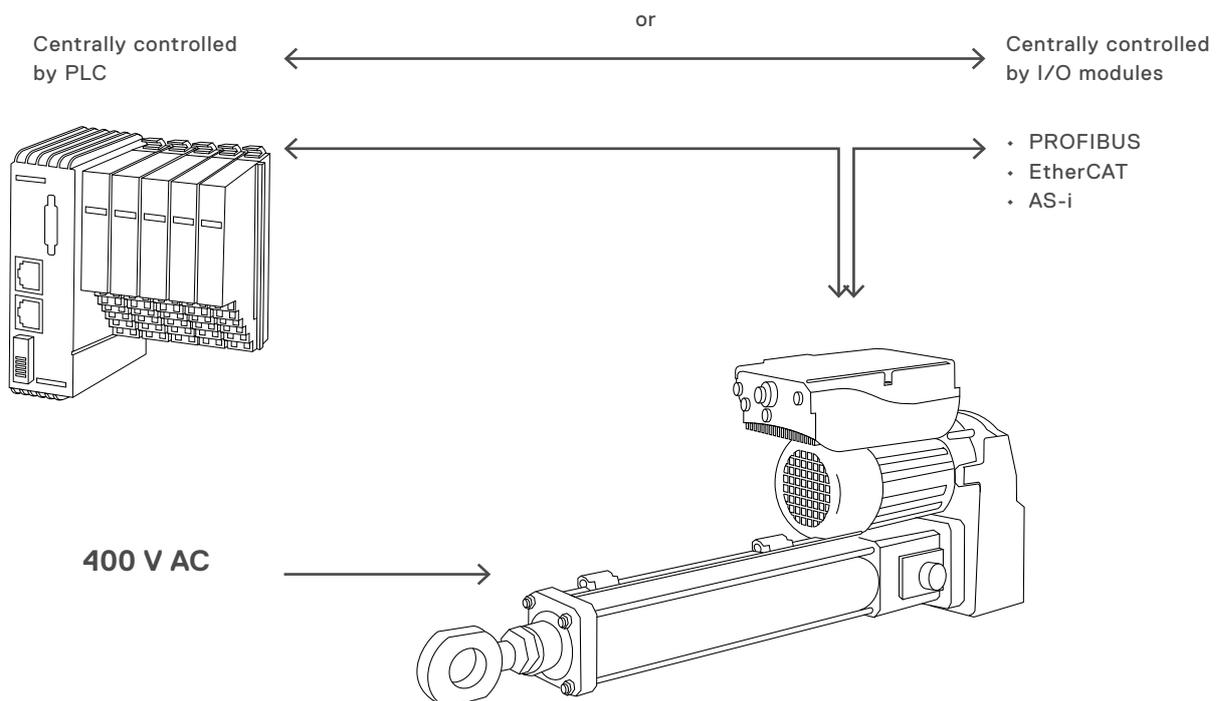

Modular concepts enable the linear units to be motorized with motors of your choice. Each motor type has its own special characteristic and allows simple integration in a large number of applications. Speed up your time to market by using the motor type and motor brand you are familiar with. If you prefer to buy complete actuators, Ewellix offers a range of AC motors, brushless DC motors and servo motors which will perfectly suit the performance of the linear units.

## AC Motor setup

- 400 V AC mains connection to power the actuator
- Central controller to control the movements and position of the actuator
- Bus communication to decentrally control the actuator and easily integrate it into automated systems

## Full flexibility

- Apart from direct connection of the digital inputs and outputs to a PLC, the control signals can be connected to virtually any fieldbus. (Profibus, Ethernet, EtherCAT, AS-i, CanOpen, ...) through I/O modules.

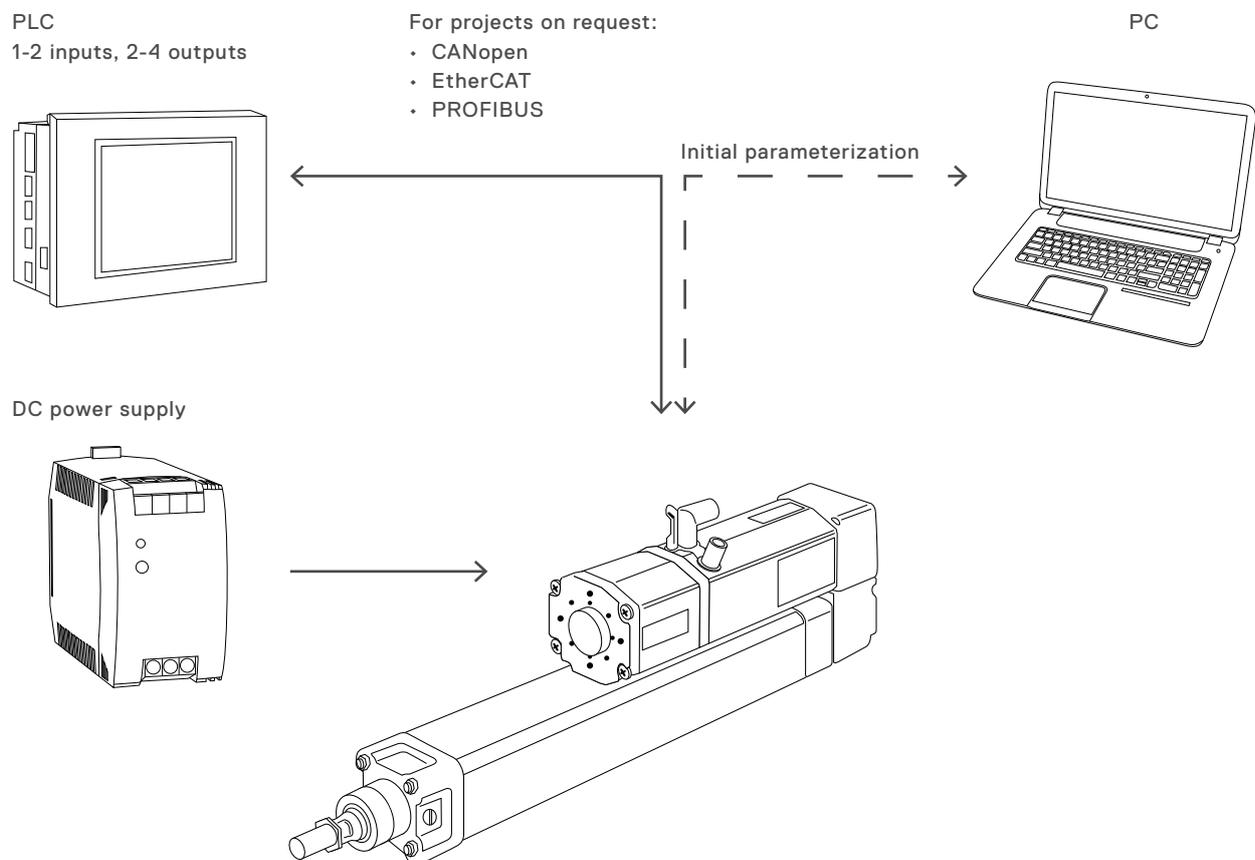

## Brushless DC motor setup

- DC power supply to provide power to the actuator
- PLC to recall the pre-parameterized motion profiles which are stored in the integrated motion controller
- PC to initially parameterize the motion controller

## Simplicity at its best

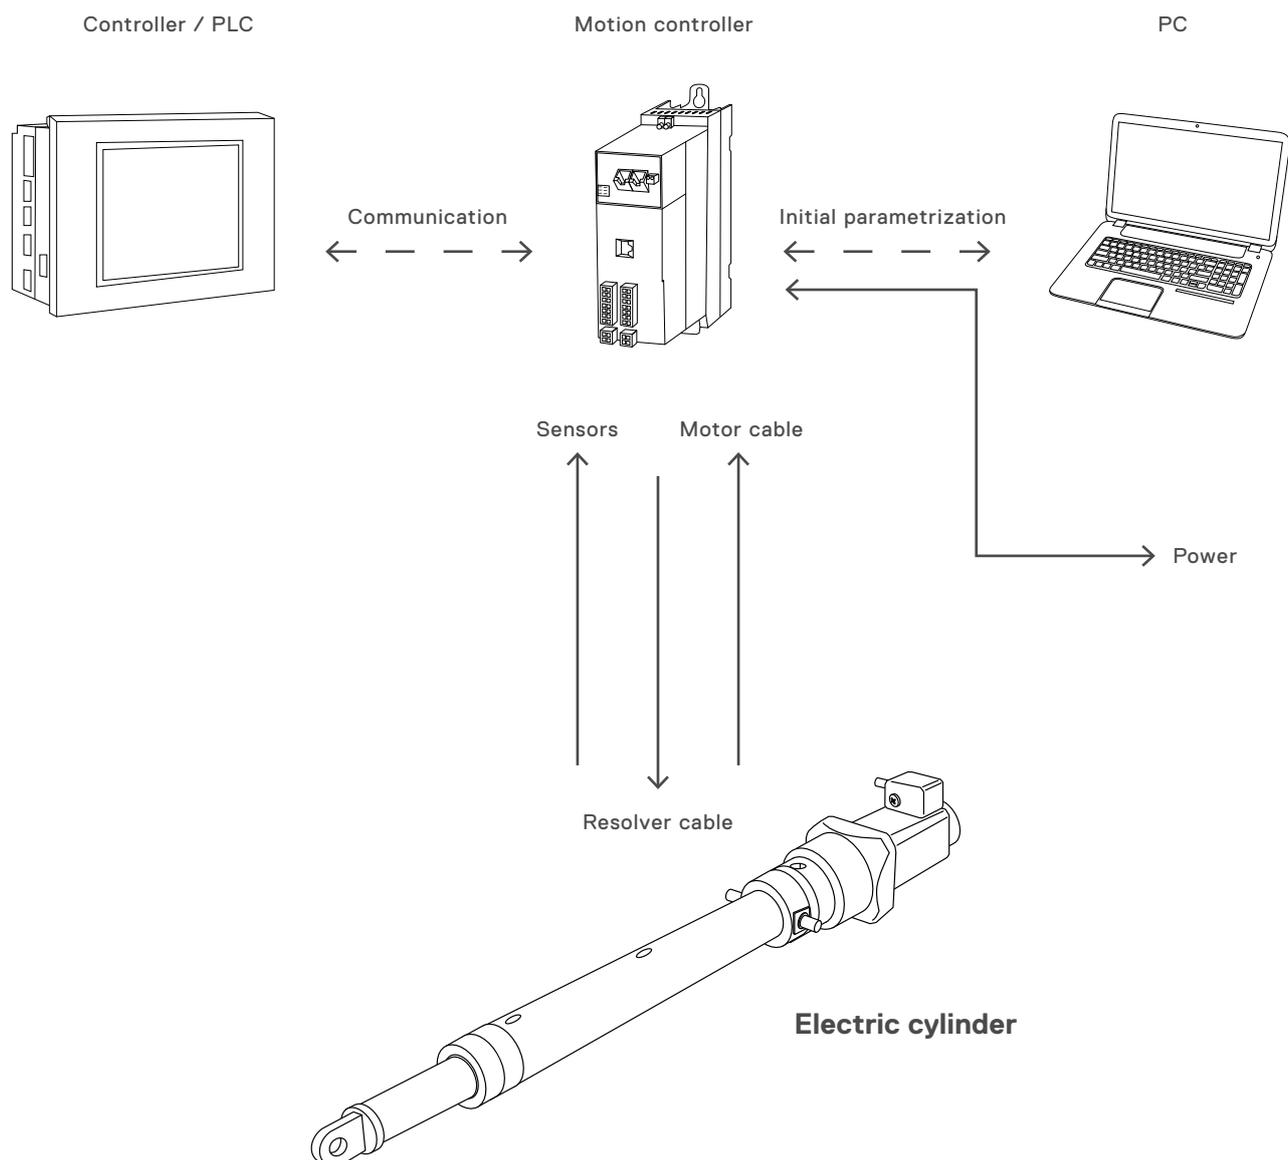

Brushless DC motors with integrated drive and brake are the cost efficient all-in-one solution for automated systems. After the initial parameterization, the system runs independently or can be controlled by a PLC.

# Servo motor setup

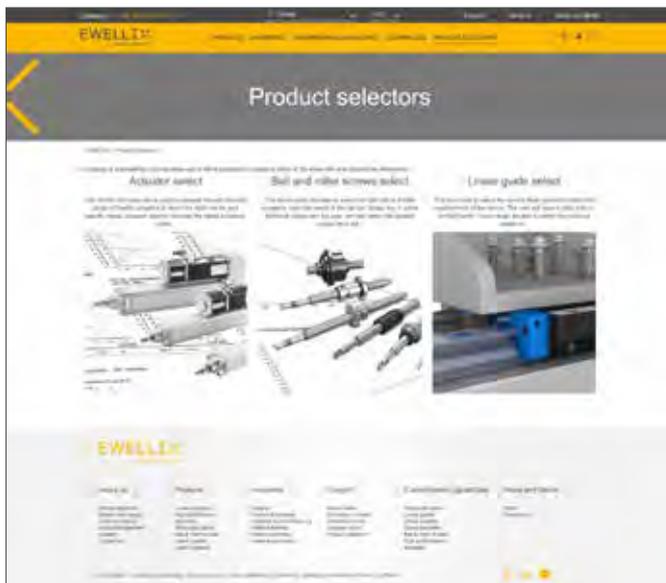

- Motion controller to control actuator motion tasks
- PC to define initial settings of motion controller.
- Communication between PLC and motion controller through digital inputs/outputs or fieldbus (CANopen, Profibus, Profinet, Ethernet, EtherCAT, Powerlink MN/CN, Powerlink CN, DeviceNet).

Servo motor systems offer a high power density and highest controllability. Use the full performance of the mechanical system by a compact and powerful servo motor and move to any position with the highest accuracy.

# Ewellix engineering tools

To simplify the product selection process, Ewellix has created a set of free Web tools that allow quick and easy navigation into the wide linear motion offering.

## Actuator Select

Users can choose the desired product family among Pillars, Linear Actuators, Rotary Actuators and Controls. Then, by entering few simple parameters, they will be guided in the product selection.

Key features include:

- Four complete product lines
- Dynamic filtering of the results
- Result ranking by application
- Product comparison (up to 3 at time)
- Indication of compatible control unit for selected Pillar or Actuator
- Cost saving calculator
- Direct link to product drawing, technical datasheet and catalogues

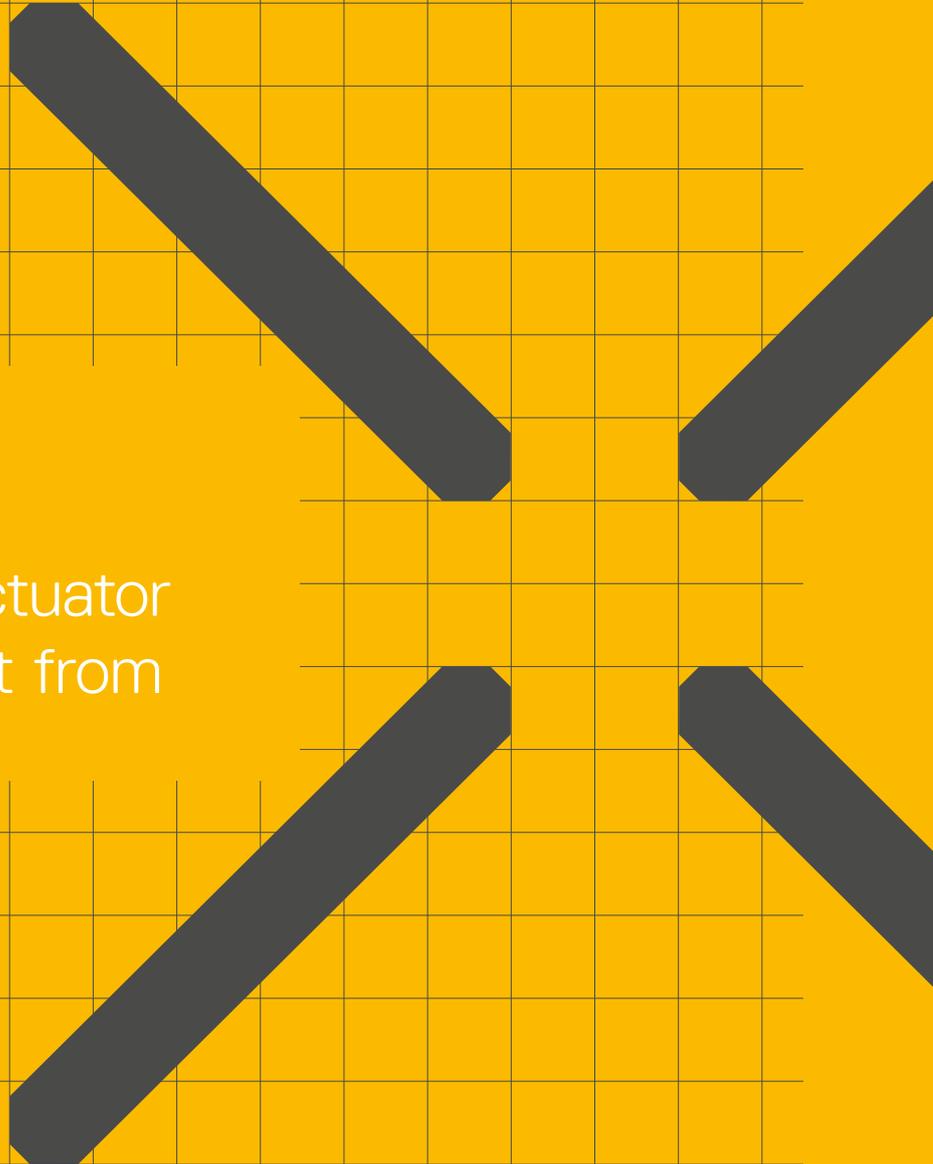

Additionally, there is a specific section dedicated to the selection of linear servo axis components (e.g., motor, linear unit and accessories) based on application data. Users enter application requirements and operating conditions, which the calculator then translates into performance specifications. For a linear servo axis, the calculator will present combinations of motor, linear unit and controller that fulfill the requirements. For in-depth technical information on the High Performance Actuator Calculator, please visit the dedicated section on **page 45**.

2

## Calculation

More than 200 Actuator  
variances to select from

# Actuator select performance calculator

The Ewellix High Performance Actuator Calculator section is a free online actuator and accessory selection tool. This calculation tool will give recommendations to select components of a linear servo axis (motor, linear unit and accessories) based on the application data. Based on the requirements and operating conditions of the user, the program will transform them into performance requirements. For a linear servo axis, it will present combinations of motor, linear unit and controller that fulfill the requirements.

The user can insert the main information about the working cycle, describing each step as absolute movement, weight and inertia of the mass to be moved. Based on that, the program will provide simple graphs that show the required position, speed and acceleration over time (→ fig. 1).

Consequently, the program suggests a list of possible solutions that fulfill the user needs in terms of performance and lifetime. For each solution, the graphs are updated to show the requirements vs. the real performance of the selection (→ fig. 2).

Fig. 1

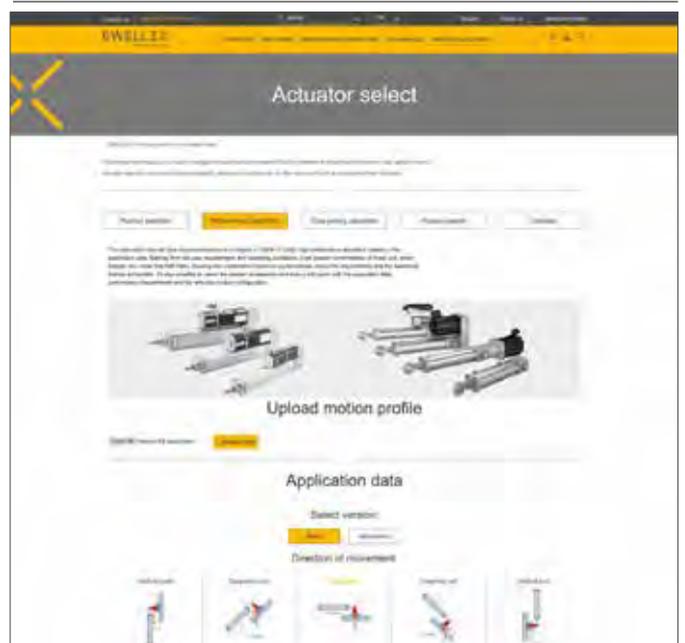

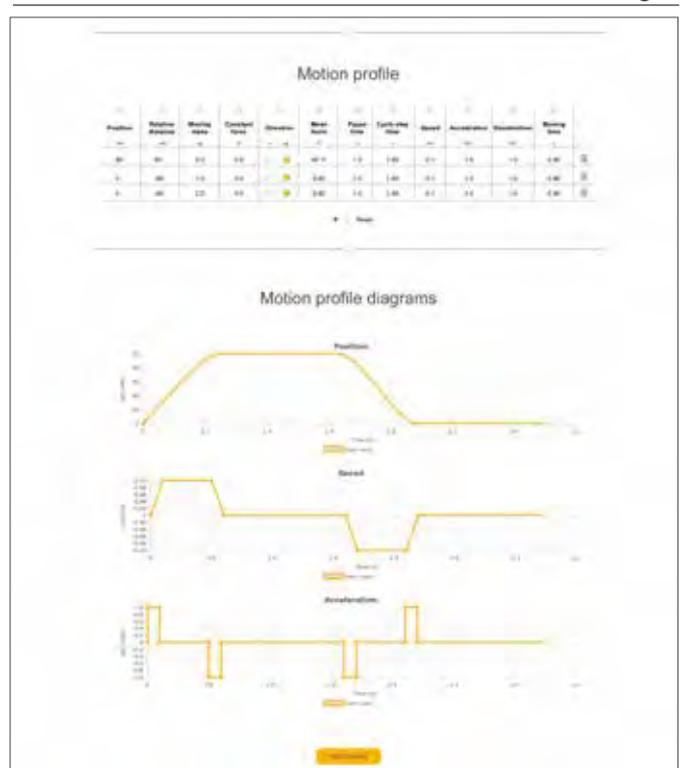

Fig. 2

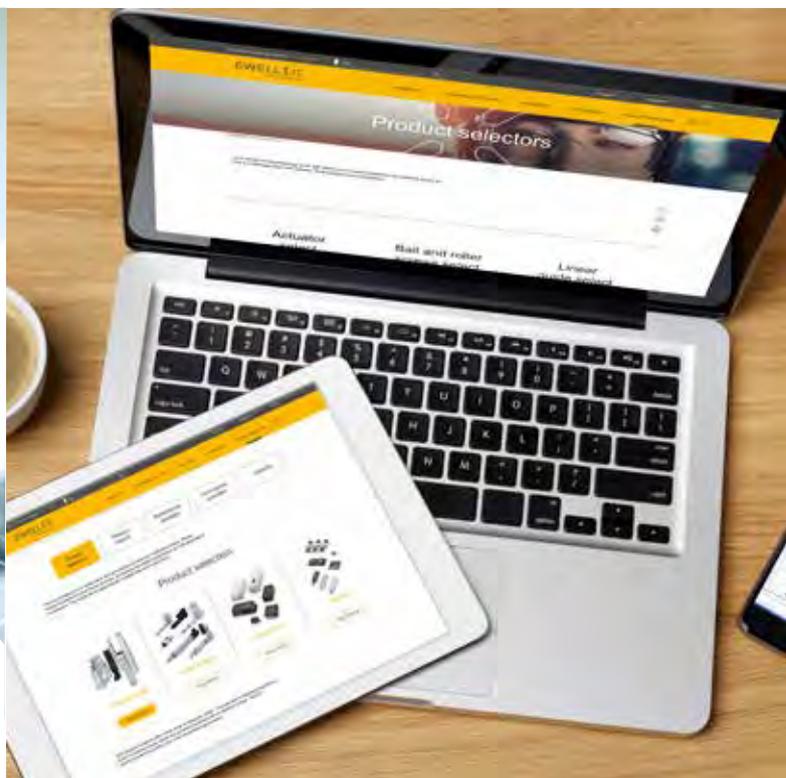

The user can then select the desired accessories, like front and rear attachments and limit switches. For each of them, it is possible to see the product picture and a brief description (→ fig. 3).

Finally, the program provides a recap of the selected solution and a printable list of the selected items for ordering (→ fig. 4).

Fig. 3

Fig. 4

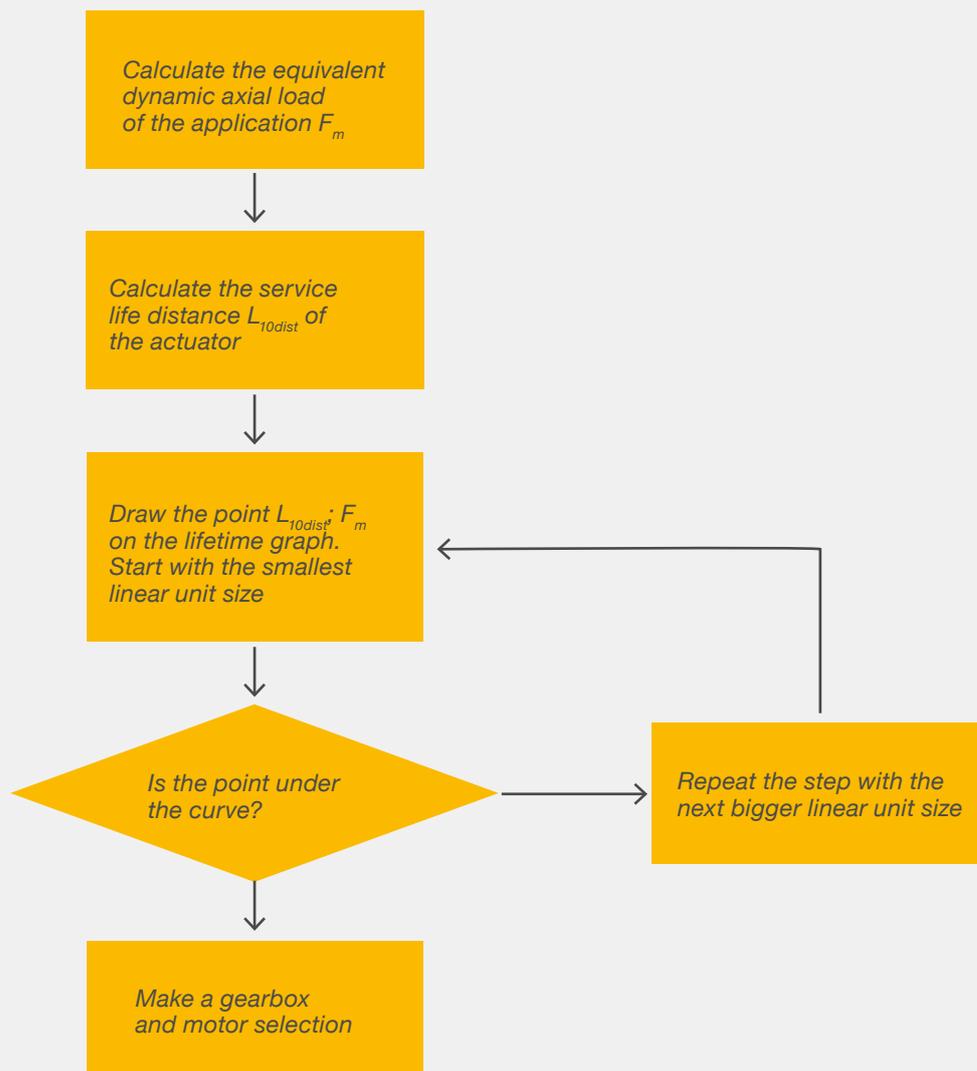

# Simplified calculation process

By following the described flow (↳ **diagram 1**), the user can select the right linear unit and motor that fulfill the application needs. Each of these steps is described in the following pages, with the related calculation formulas to be used and a real example. The main factors to be considered from the application are the equivalent dynamic axial load, acting on the actuator, the travel distance to be achieved and the desired speed during the working cycles. From these values,

user can then define the right actuator size and the required motor performances, in terms of torque and rotating speed. Finally, it's then possible to define the desired type of motor adapters, to match the possible dimensional constraints or to get a reduction ratio between the motor and the linear unit. If further assistance is needed, please contact Ewellix to get complete technical support.

2

Diagram 1

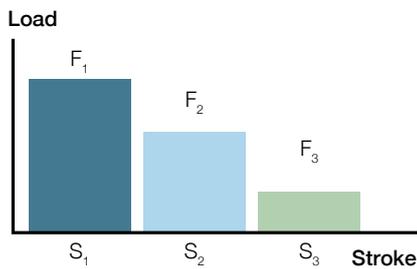

# General calculation formulae

## How to calculate the equivalent dynamic axial load $F_m$ of the application.

In most of the applications, the magnitude of the load fluctuates over the travelling distance. The service life of the linear unit depends on the load acting on it. To simplify the calculation we calculate the equivalent dynamic axial load over a full motion cycle  $F_m$  which has the same influence on the linear unit's service life as the actual fluctuating load.

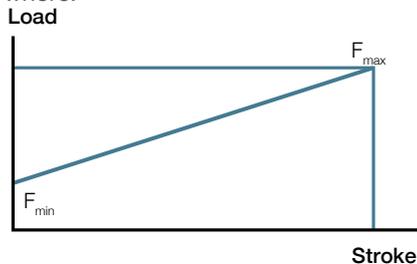

$$F_m = \sqrt[3]{\frac{F_1^3 \times s_1 + F_2^3 \times s_2 + F_3^3 \times s_3 + \dots}{s_1 + s_2 + s_3}} = 570 \text{ N}$$

or

$$F_m = \frac{F_{\min} + 2F_{\max}}{3}$$

where:

- $F_m$ : Equivalent dynamic axial load in N
- $F_1, F_2, \dots, F_n$ : Load exerted over a segment of travelled distance  $s_n$
- $S_1, S_2, \dots, S_n$ : Travelling distance over which the load  $F_n$  is exerted

## Example to calculate the equivalent dynamic axial load

- $F_1 = 700 \text{ N}, s_1 = 200 \text{ mm}$
- $F_2 = 500 \text{ N}, s_2 = 0 \text{ mm}$
- $F_3 = 300 \text{ N}, s_3 = 200 \text{ mm}$

$$F_m = \sqrt[3]{\frac{700^3 \times 200 + 500^3 \times 0 + 300^3 \times 200}{200 + 0 + 200}} = 570 \text{ N}$$

or

$$F_m = \frac{300 + 1\,400}{3} = 566 \text{ N}$$

# How to calculate the lifetime distance $L_{10dist}$

The service life distance  $L_{10dist}$  is defined as the life in km that 90% of a sufficiently large group of apparently identical actuators can be expected to attain or exceed.

$$L_{10dist} = \frac{S_{cycle} \cdot t_L \cdot 3,6}{t_{cycle}}$$

$$L_{10dist} = s_{cycle} \cdot n_{cycles}$$

where:

- $L_{10dist}$ : Lifetime distance in km
- $S_{cycle}$ : Distance travelled per motion cycle in m (both directions)
- $t_{cycle}$ : Time per motion cycle in s (from one motion cycle to the next)
- $t_L$ : Required lifetime in hours
- $n_{cycles}$ : Number of cycles (in 1 000)

## Example to select a linear unit

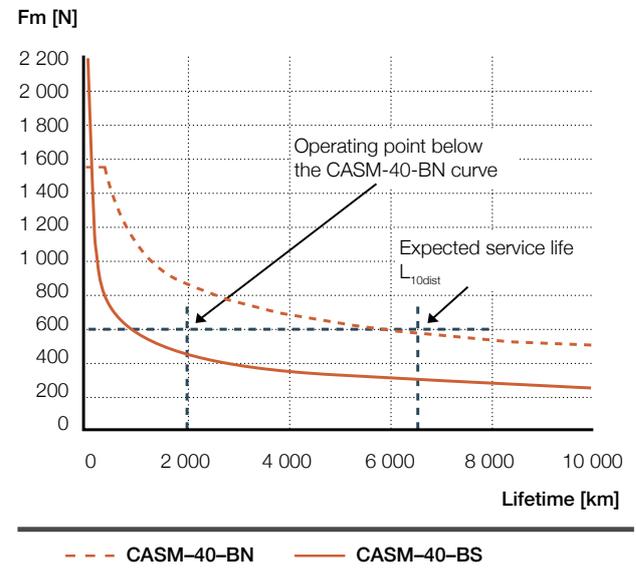

Total distance travelled per motion cycle:  $s_{cycle} = 0,4$  m  
 Total time per motion cycle:  $t_{cycle} = 20$  s  
 Required lifetime:  $t_L = 5$  years  $\times$  230 days/year  $\times$  24 hours/day = 27 600 hours  
 $n_{cycles} = 3$  cycles/minute  $\times$  60 minutes  $\times$  24 hours  $\times$  230 days  $\times$  5 years / 1000 = 4 968  $k_{cycles}$

$$L_{10dist} = \frac{0,4 \times 27\,000 \times 3,6}{20} = 1\,987 \text{ km}$$

$$L_{10dist} = 0,4 \times 4\,968 = 1\,987 \text{ km}$$

## Select the linear unit

Equivalent dynamic axial load  $F_m = 570$  N  
 Lifetime distance  $L_{10dist} = 1\,987$  km

The operating point is below the CASM-40- BN curve. It is the smallest linear unit which fulfills the requirements. The expected service life is almost 6 500 km.

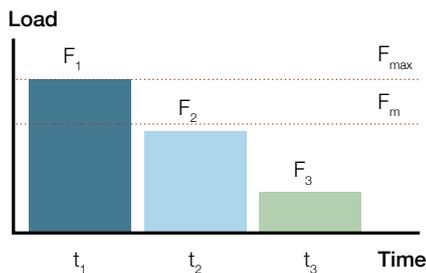

# Motor selection

## How to calculate the thermal load of the motor $F_{th}$

To calculate the mean motor torque, we first need to calculate the thermal load  $F_{th}$  over the motor running time. Please note that the use of a motor brake during pause time will reduce the needed power of the motor.

$$F_{th} = \sqrt{\frac{F_1^2 \times t_1 + F_2^2 \times t_2 + F_3^2 \times t_3}{t_1 + t_2 + t_3}}$$

- $F_{th}$ : Equivalent thermal load of the application
- $F_1, F_2, \dots, F_n$ : Load exerted over a time (percentage of full motion cycle time  $t_{cycle}$ )
- $t_1, t_2, \dots, t_n$ : Time over which the load  $F_n$  is exerted

### Example

$F_1 = 700 \text{ N}, t_1 = 2 \text{ s}$   
 $F_2 = 500 \text{ N}, t_2 = 15 \text{ s}$  (No travelling distance, but to hold a load of 500 N in position)  
 $F_3 = 300 \text{ N}, t_3 = 3 \text{ s}$   
 If no brake is engaged

$$F_{th} = \sqrt{\frac{700^2 \times 2 + 500^2 \times 15 + 300^2 \times 3}{1 + 15 + 3}} = 500 \text{ N}$$

If a brake is engaged during the period  $t_2$  to hold the load ( $F_2 = 0$  for the motor)

$$F_{th} = \sqrt{\frac{700^2 \times 2 + (0^2 \times 15) + 300^2 \times 3}{1 + 15 + 3}} = 250 \text{ N}$$

## How to select an Ewellix – verified motor

When using an Ewellix-verified motor, make sure that the continuous force of the actuator mentioned in the system capabilities is equal to or higher than the calculated thermal load  $F_{th}$  of your application.

### Example

The continuous force  $F_c$  of the CASM-40-BN inline configuration with Siemens 1FK7022 servo motor is 301 N. This is only enough if the brake is activated during the pause time  $t_2$ . ( $F_{th} = 250 \text{ N}$ ) (→ table 1).

If the system should run without using a brake, the bigger motor 1FK7034 is needed with a continuous force of 572 N ( $F_{th} = 500 \text{ N}$ ) (→ table 2).

Table 1

CASM-40 inline configuration with Siemens 1FK7022

	Unit	Peak force $F_p$	Cont. force $F_c$
CASM-40-LS	N	600	710
CASM-40-BS	N	2 375	758
CASM-40-BN	N	1 447	302

Table 2

CASM-40 inline configuration with Siemens 1FK7034

	Unit	Peak force $F_p$	Cont. force $F_c$
CASM-40-BS	N	2 375	1 485
CASM-40-BN	N	1 550	574

## How to select a motor not verified by Ewellix

If using a motor of your choice, the force capabilities of the linear units have to be converted into motor torque specifications for the motor. The minimum required continuous torque and the maximum torque of the motor need to be calculated. This could either be done by considering screw leads and friction or by a simplified calculation using information about the linear unit's maximum input torque to get the maximum force.

### Calculation of the required continuous torque of the motor

$$M_{Ac} = \frac{M_{max} \cdot F_{th}}{F_{max}}$$

where

- $M_{Ac}$ : Required continuous torque of the motor in Nm
- $M_{max}$ : Maximum input torque of the linear unit in Nm
- $F_{th}$ : Equivalent thermal load of the application in N
- $F_{max}$ : Maximum dynamic axial force of the linear unit in N

#### Example (if using the brake)

$$M_{Ac} = \frac{4 \times 250}{1\ 550} = 0,65 \text{ Nm}$$

### Calculation of the maximum required torque of the motor

$$T_{Amax} = \frac{T_{Umax} \cdot F_{Amax}}{F_{Umax}}$$

where

- $M_{Amax}$ : Required maximum torque of the motor in Nm
- $T_{Umax}$ : Maximum input torque of the linear unit in Nm
- $F_{Amax}$ : Maximum dynamic axial load of the application in N
- $F_{Umax}$ : Maximum dynamic axial force of the linear unit in N

$$M_{Amax} = \frac{4 \times 700}{1\ 550} = 1,81 \text{ Nm}$$

In our example, the continuous torque of the motor should be higher than 0,65 Nm (if using the brake) while the maximum torque must exceed 1,81 Nm to move the load of 700 N.

This calculation is valid for inline adapters and parallel adapters with a belt, where the gear ratio equals 1 and the efficiency is close to 100%.

The rotational speed is directly linked to the linear speed. Divide the linear speed by the screw lead to obtain the rotational speed. The relation of torque and force is a constant factor: To get the torque, take the force \*  $M_{max} / F_{max}$

#### Please Note

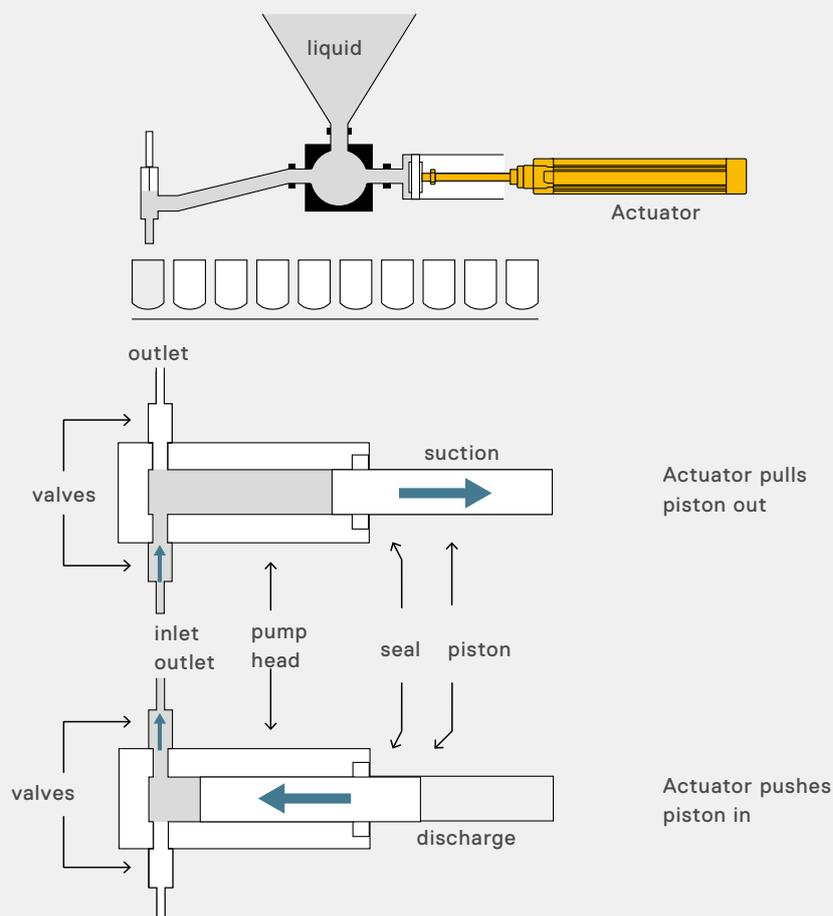

The dynamic torque of the motor may vary with the speed. Please make sure that your motor is able to reach the needed speed, acceleration and max. torque for your application.

# Calculation examples

## Dosage of liquids with CASM electric cylinders

### Technical requirements

Stroke:	$s = 100 \text{ mm}$
Mounting position:	horizontal
Push force:	$F_1 = 250 \text{ N}$
Pull force:	$F_2 = 50 \text{ N}$
Cycles:	90 cycles per minute
Working time:	16 hours per day
Lifetime:	2 years (520 days)

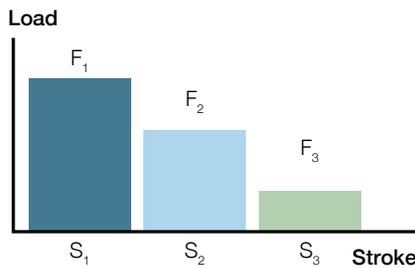

# Selection of the linear unit

## Calculate the equivalent dynamic axial load $F_m$ of the application

$$F_m = \sqrt[3]{\frac{F_1^3 s_1 + F_2^3 s_2 + F_3^3 s_3 + \dots}{s_1 + s_2 + s_3}}$$

where

- $F_m$  = Equivalent dynamic axial load in N
- $F_1, F_2, \dots, F_n$  = Load exerted over a segment of travelled distance  $s_n$
- $s_1, s_2, \dots, s_n$  = Travelling distance over which the load  $F_n$  is exerted

$$F_m = \sqrt[3]{\frac{250^3 \times 100 + 50^3 \times 100}{100 + 100}} = 199 \text{ N}$$

## Calculate the service life distance $L_{10dist}$

$$L_{10dist} = s_{cycles} \times n_{cycles}$$

where:

- $L_{10dist}$  = Lifetime distance in km
- $s_{cycle}$  = Distance travelled per motion cycle in m (both directions)
- $n_{cycles}$  = Number of cycles (in 1 000 cycles)

Distance travelled per motion cycle:

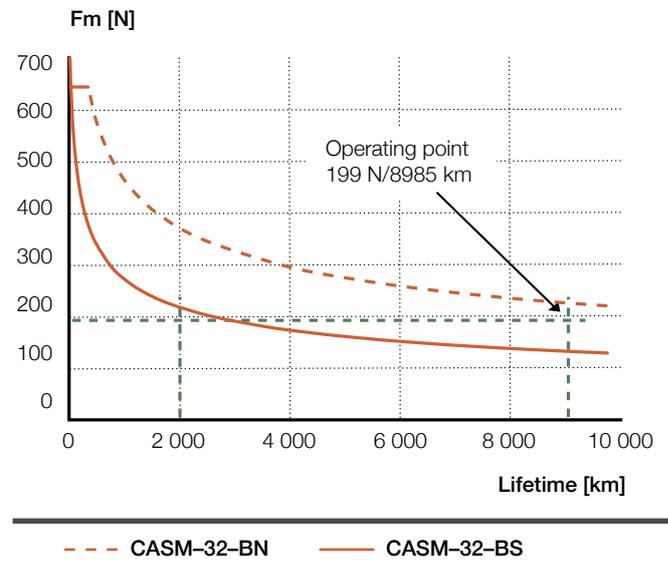

$$s_{cycle} = \text{extend } 100 \text{ mm} + \text{retract } 100 \text{ mm} = 0,2 \text{ m}$$

$$\text{Number of cycles } n_{cycles} = 90 \text{ cycles} \times 60 \text{ minutes} \times 16 \text{ hours} \times 520 \text{ days} = 44\,928 \text{ k}_{cycles}$$

$$L_{10dist} = 0,2 \times 44\,928 = 8\,985,6 \text{ km}$$

## Select the linear unit

Equivalent dynamic axial load  $F_m = 199 \text{ N}$   
 Lifetime distance  $L_{10dist} = 8\,985,6 \text{ km}$

The operating point is below the dashed line. The CASM-32-BN is the smallest linear unit for this application which fulfills the requirements.

Selected linear unit: CASM-32-BN with 100 mm stroke.  
 The expected service life is > 10 000 km

## Speed check

To move 200 mm within 0,667 seconds (90 cycles per minute), we need a speed of at least  $200 \text{ mm} / 0,667 \text{ s} = 300 \text{ mm/s}$ .

The CASM-32-BN can do 500 mm/s.

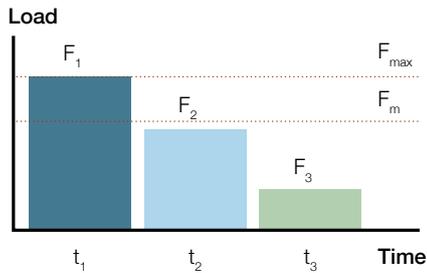

Linear unit CASM-32-BN

# Selection of the motor

## Calculation of the thermal load of the motor $F_{th}$

$$F_{th} = \sqrt{\frac{F_1^2 t_1 + F_2^2 t_2 + F_3^2 t_3 + \dots}{t_1 + t_2 + t_3}}$$

where:

- $F_{th}$ : Equivalent thermal load of the application
- $F_1, F_2, \dots, F_n$ : Load exerted over a time (percentage of full motion cycle time  $t_{cycle}$ )
- $t_1, t_2, \dots, t_n$ : Time over which the load  $F_n$  is exerted

$$F_{th} = \sqrt{\frac{250^2 \times 0,333 + 50^2 \times 0,333}{0,333 + 0,333}} = 180 \text{ N}$$

What if we would move with maximum speed and engage the brake during the pause time? The maximum speed is 500 mm/s. We could do the 100 mm stroke within 0,2 seconds (acceleration and deceleration disregarded).

$$F_{th} = \sqrt{\frac{250^2 \times 0,2 + 50^2 \times 0,2 + 0,333}{0,2 + 0,2 + 0,267}} = 140 \text{ N}$$

In some cases, a smaller (cheaper) motor can be used if we are using a brake.

## Using an Ewellix verified motor

Make sure that the continuous force of the actuator is higher than the calculated thermal force  $F_{th}$  of the application.

The continuous force  $F_c$  of the CASM-32-BN with a Siemens 1FK7015 motor is 169 N. This would only work if we are moving with maximum speed and engage the brake during the pause time (→ table 3, fig. 1 and 2).

If we don't want to use a brake, the bigger motor 1FK7022 is needed which allows a continuous force  $F_c$  of 385 N.

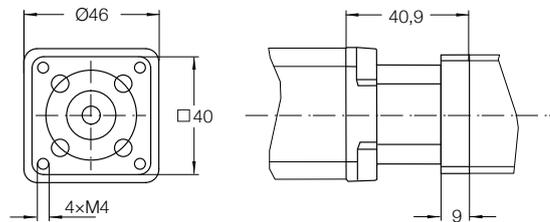

Table 3

### CASM-32 inline configuration with Siemens 1FK7015

	Unit	Peak force $F_p$	Cont. force $F_c$
CASM-32-LS	N	300	47
CASM-32-BS	N	700	503
CASM-32-BN	N	528	169

# Fluid power replacement advices

To realize all the advantages of electro-mechanical actuators, the approach to system redesign must be different from the commonly adopted one. As pneumatic, hydraulic and electromechanical cylinders have unique features, there needs to be a change in thinking when it's time to replace one with the other.

In fact, it's important to understand the different mechanical and electrical specifications along with the required budget, as there are always multiple ways to replace one application. This requires more time to analyze and study but it's the only way to make an effective product selection that can save a lot of money at the end.

There are some common mistakes that designers can make when replacing a fluid powered cylinder with an electro-mechanical one that may lead to oversized systems. To avoid them, it's important to consider the following:

## Define the real force requirement

In many applications, the real work load and related required push and pull forces are not known, as it's quite easy with fluid power to oversize the system by using higher pressures or bigger cylinder diameters. This can lead to an oversize of the actuator screw and motor that significantly increases the cost. Instead, by measuring the real force in the application, it's possible to select an optimized solution that delivers the required performance at the right price.

## Evaluate the duty cycle in operation

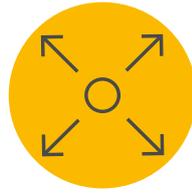

While duty cycle can have a minor impact on fluid powered systems, in actuators it can determine the type of motor technology required and therefore the related system complexity and cost. If the application is done from time to time (e.g. 1 minute operating – 4 minutes standing still), it's possible to use brushed motors that can deliver the required power much cheaper than equivalent brushless motors with drivers.

### Analyze the mechanical layout

Hydraulics can deliver more power in a smaller package than electromechanical actuators. In case of leveraged connections (e.g. scissor mechanism), it's quite common to have an unfavorable situation where the high forces are exerted over a very short stroke. By slightly revising the mechanical layout, it may be possible to have more favorable leverages that spread the load over a longer stroke, requiring less peak output power and then a smaller actuator.

### Define the required motion accuracy

Depending on the application, it may be needed to perform a simple motion from one position to another and back or to have fine control of the speed and acceleration in multiple positions. With electromechanical actuators, the simple DC and asynchronous AC motors can perform basic movements in an ON/OFF control mode while with a servo motor, it's possible to achieve complete control in operation with the use of a motion controller. Moreover, depending on the positioning accuracy required, it's possible to select a simple trapezoidal screw with axial play or a recirculating pre-loaded roller screw for the ultimate positioning precision and repeatability, down to microns. The cost and control complexity rises linearly allowing a direct selection tailored to real application needs.

With more than 40 years of experience in making electromechanical actuators, Ewellix has extensive expertise in sizing electromechanical solutions for different types of industries and applications. A dedicated team of Application

Engineers are available to support customers in defining the right solution, and advising on the best choice based on theoretical calculation and field expertise.

Ewellix offers the widest range of actuators on the market that can also be customized to fit any application requirements.

## Product range

Up to 500 kN Axial Force

# Electric cylinders

## CASM-25

### Features

- Compact design: 36 × 36 mm body section dimension
- High load capacity (Static 2,6 kN, dynamic 300 N)
- High positioning accuracy and repeatability due to precision ball screw
- High duty cycles
- Virtually maintenance-free
- Push tube with anti-rotation function

### Benefits

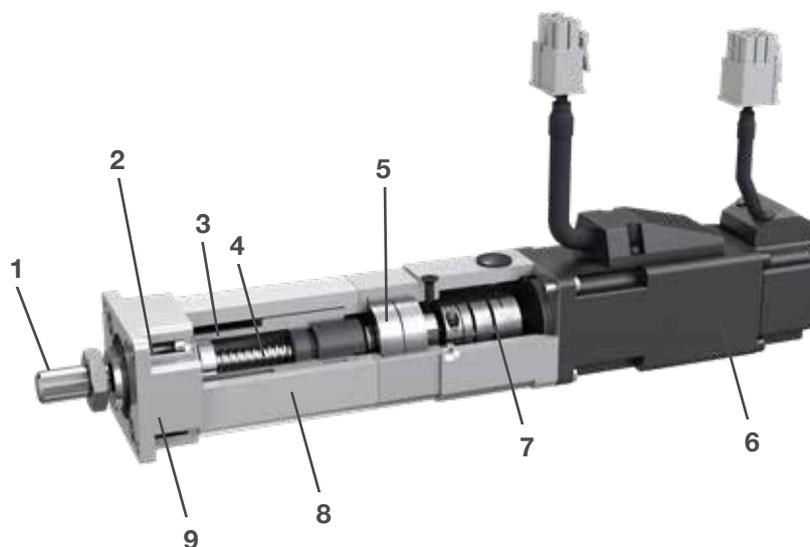

- Designed for Automation and Electronics Industry
- Cost effective solution
- Compatible with any third party motor brand
- Easy installation
- Space saving solution
- Long life in operation

## Product description

In addition to standard electrical cylinder product range, Ewellix offers an extensive customization program that is able to fulfill specific application needs.

The CASM-25 actuator is a customized solution designed for light automation applications and electronic manufacturing industry. This miniature actuator can deliver high static and dynamic force with precise motion and long life in operation.

Ewellix solution is based on a high precision ballscrew SD8 x 2,5, with a full aluminium body, resulting in a very compact solution with high power density.

1. Stainless steel push tube
2. Shaft seal to protect against contaminants ingress
3. Sinter filter for high airflow
4. Flat seal between housings
5. High quality ball and lead screws with low axial play and low friction, lubricated for the whole product life
6. Magnet ring for proximity sensors
7. Anti-rotation device with overload protection
8. High-quality SKF bearings
9. Anodised aluminium profile with proximity sensor slots

# Electric cylinders

## CASM-32/40/63

### Features

- Modular cylinder system in three different sizes
- At least three different screws for each cylinder size
- Inline and parallel (belt) gearboxes
- Customized motor adapter plate
- Meets ISO-15552 standards
- High level of precision and repeatability
- Wide range of accessory parts

### Benefits

- Optimal for a wide range of power and lifetime requirements
- Wide range of speed and force
- Mechanically fits most applications
- Fits most of brushless DC and servo motors
- Easy to replace pneumatic cylinders
- Accurate positioning (depending upon feedback system of the motor)
- Flexibility in mounting cylinders

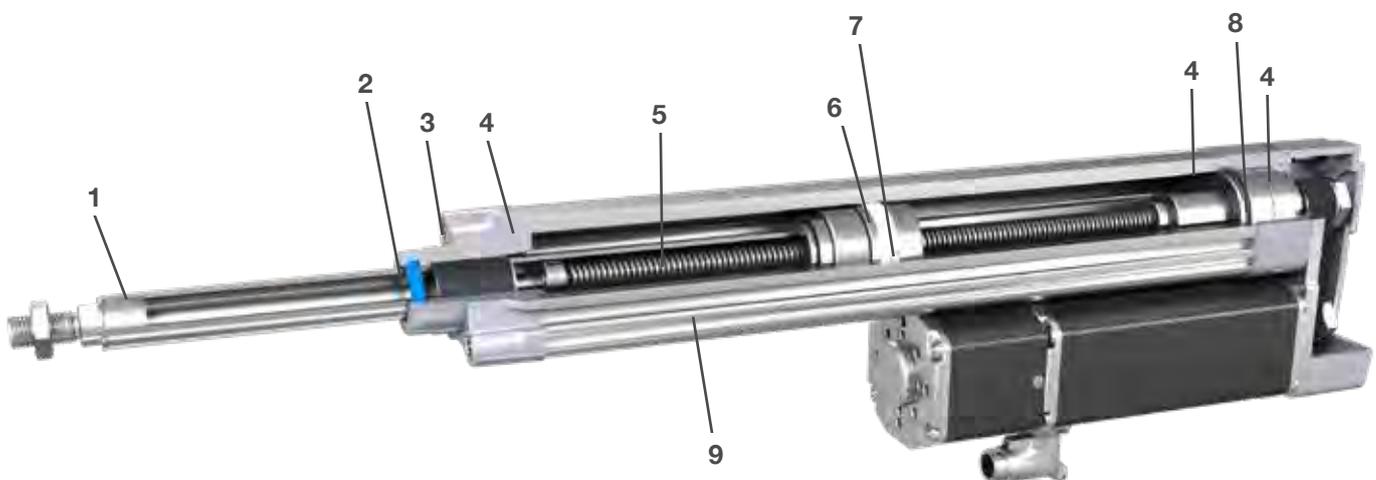

## Product description

CASM electric cylinders are ideally suited to perform fast and powerful linear movements. Unlike pneumatic or hydraulic cylinders, CASM electric cylinders are flexible and thus can be positioned precisely. In addition, due to a reduced number of components, the whole system is more cost effective, resulting in lower energy and maintenance costs.

The CASM modular concept enables easy connection to your preferred motor and control system. This can reduce design and programming costs considerably.

Thanks to high grade materials, a sealing system with IP54S level protection and high quality manufacturing, CASM electric cylinders can also be used long term even under adverse conditions.

The low backlash design provides positioning precision of up to  $\pm 0,01$  mm. Together with various screws for different speeds and forces, CASM electric cylinders are the optimum solution for a variety of applications.

1. Stainless steel push tube
2. Shaft seal to protect against contaminants ingress
3. Sinter filter for high airflow
4. Flat seal between housings
5. High quality ball and lead screws with low axial play and low friction, lubricated for the whole product life
6. Magnet ring for proximity sensors
7. Anti-rotation device with overload protection
8. High-quality SKF bearings
9. Anodised aluminium profile with proximity sensor slots

# Motors and gearboxes

## Servo motors

The Siemens motors provided by Ewellix come with a multi-pole resolver, a shaft-end with no keyway and a holding brake. In addition, they are equipped with a Drive-CLiQ interface. A rotating plug adapter simplifies the connection and cable routing in all installation positions. For more information, please visit the following sites:

## Brushless DC motors

Brushless DC motors are perfectly suited to replace pneumatic cylinders in many applications. The motors provided by Ewellix are equipped with internal controllers and are very simple to set up. Connected to the power supply, the motors can be programmed by a computer with up to 14 motion profiles. The profiles can be activated by 2-4 binary inputs (PLC outputs or switches).

The internal encoders enable for high positioning accuracy while the internal brake secures the system in case of a power loss.

# Electric cylinders

## CASM-100

### Features

- Electric cylinder with high modularity
- Ball-screws or roller-screws
- Inline and parallel gearboxes
- Standardized interfaces
- High level of precision and repeatability
- Wide range of accessories

### Benefits

- For a wide range of applications with different performance and lifetime requirements
- Optimal lifetime even at very high forces
- High level of flexibility with variance of body assembly fitting most of the applications.
- Fits AC motors and servo motors
- Accurate positioning

## Product description

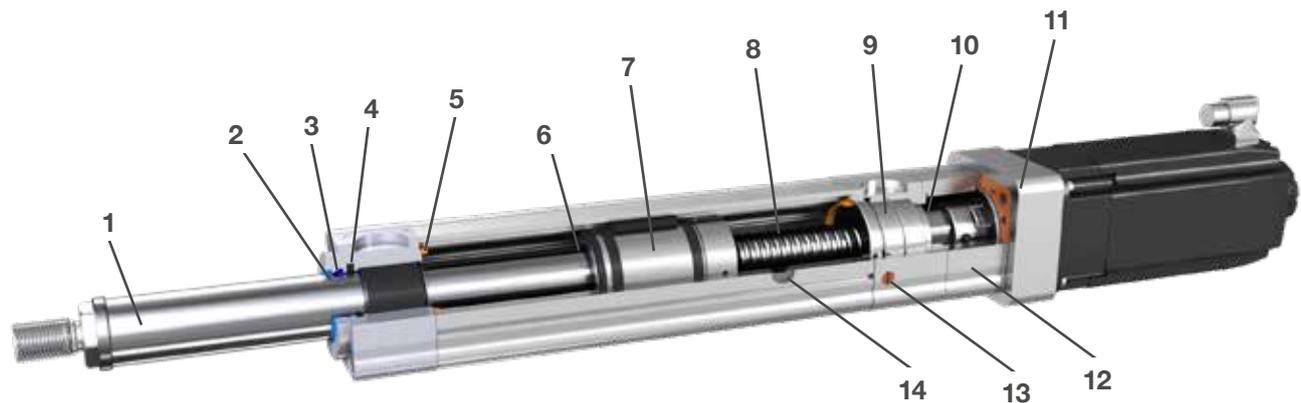

Ewellix developed an innovative modular electric cylinder platform to address most of the applications in the automation and heavy machinery industries, mainly replacing hydraulic solutions. In this new design, instead of limiting the selection on the “linear unit - gearbox – motor” modules only, Ewellix takes it a step further. The modularity has been extended to the base component level. Within each module, the customer can select the components inside to build a custom-like solution as standard. This concept makes it possible to find the optimal solution for almost every application within its power range with the best performance/cost ratio.

To facilitate customers in defining their own actuator, Ewellix has released an online configurator on [Ewellix.com](http://Ewellix.com), where

you can configure your optimal CASM-100 cylinder in just a few steps. Since the cylinders are assembled with standard components, any customer defined configuration will not influence the lead time.

To meet any space and performance requirements, Ewellix provides inline and parallel gearboxes as well as AC and servo motors. All motors are equipped with specific adapters to keep the same mechanical interface, independent of the selected motor type.

This standardized interface allows customers to also attach their own preferred motor, that customers are already familiar with (motor and drives).

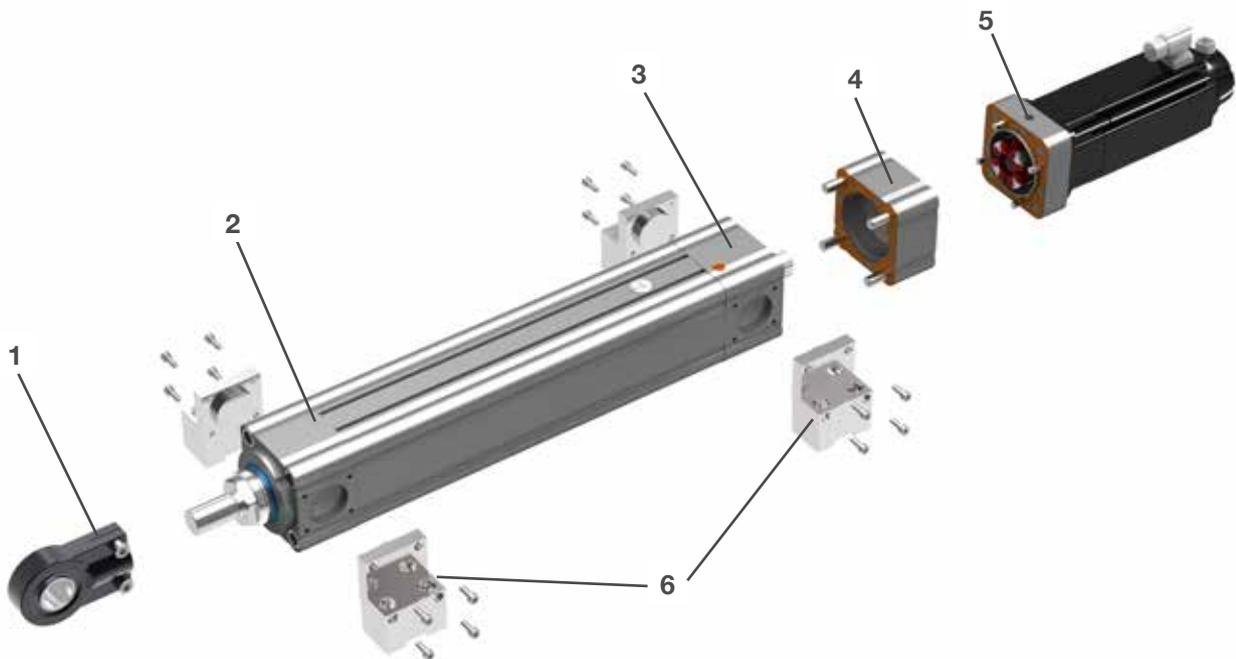

1. Push tube
2. Wiper ring
3. Solid oil ring
4. Sealing ring
5. Rubber bumper
6. Magnet ring for optional proximity sensors
7. Nut with guiding rings and anti-rotation
8. High quality ball and roller screws with low axial play and low friction
9. High quality bearings
10. Radial shaft sealing ring
11. Motor adapter and motor
12. Gearbox
13. Sinter filter for high airflow
14. Relubrication port

## System overview

The CASM-100 modular system comprises different components that are connected to each other through standardized interfaces.

Each component provides a unique function for the complete system and is connected as shown below.

1. Front attachment: mechanical connection between the actuator and the moving part of the application. It is screwed to the push tube through the standard male thread.
2. Front housing: component that supports the push tube, through a dedicated bushing, also including the front sealing package
3. Bearing housing: component that contains the set of ball bearings that support the screw shaft
4. Gearbox: connecting module between the linear unit and the motor adapter. Is available in parallel or inline versions, with different reduction ratios
5. Motor adapter: connecting module between the gearbox and the electric motor
6. Housing attachments: actuator body attachments, connected to the fix part of the application. Depending on the attachment type, they can be installed on the different housings - front, bearing or gearbox.

## Performance overview of linear units

Linear unit	$F_{max}$ kN	$F_{0max}$ kN	$V_{max}$ mm/s
CASM-100-BA	23	52	260
CASM-100-BB	48	60	210
CASM-100-BC	60	60	750
CASM-100-RA	82	82	890

## Performance overview of actuators

CASM-100-RA	1FK7105	inline	24,1	75,5	500

# Motors

## Servo motors

The Siemens motors provided by Ewellix come with a differential resolver or multi-turn encoder, a shaft-end with key-way and a holding brake. In addition, they are equipped with a Drive-CLiQ interface. A rotating plug adapter simplifies the connection and cable routing in all installation positions. \* Maximum speed is 3 000 with lower torque

## Motor adapter

The modular system of CASM-100 enables the use of virtually any kind of motor.

The motor adapter module makes your motor fit the entire CASM-100 range, independent of the configuration. In fact, thanks to the standardized mechanical interface, this module can be directly attached to any inline or parallel gearbox. Sealings, screws and half coupling parts are included in the package. Each motor adapter is provided with blind threaded hole M12 to screw an eye bolt for easier actuator handling.

### Dimensional drawing

	Motor LM1	LM2	J6	Motor adapter G	L13

### Customer option

- 000 No option

## Gearboxes

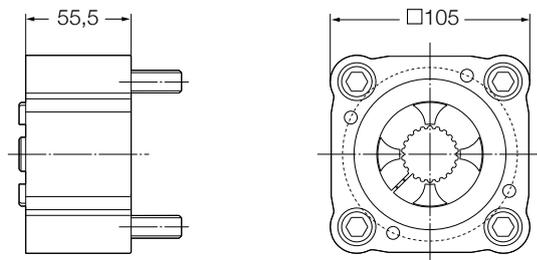

### Inline gearbox

Inline gearboxes consist of a housing which fits on one side to the linear unit and on the other side to the motor adapter with the matching coupling. The coupling can be pushed on the shaft of the linear unit and locked by a screw. The counterpart of the coupling is delivered with the motor adapter.

The inline gearbox transmits the motor torque (max. 150 Nm) directly to the linear unit with a gear ratio 1:1 and is maintenance-free.

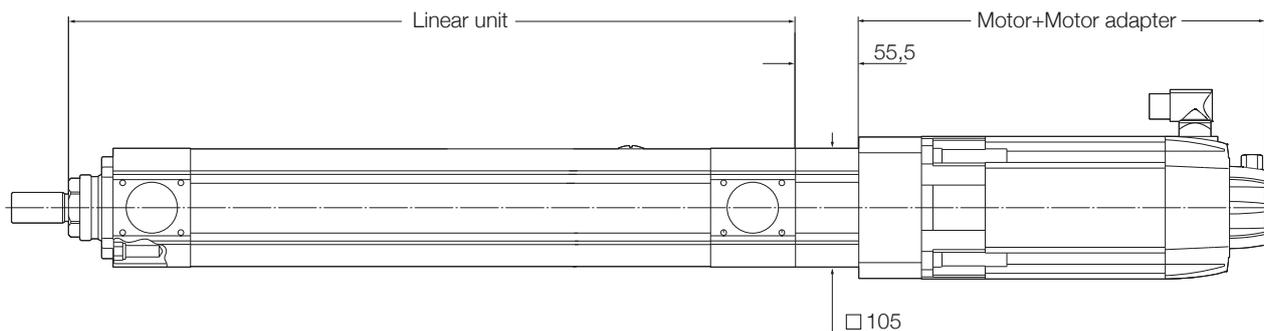

### Dimensional drawing

All dimensions in mm

### Complete actuator

All dimensions in mm

## Parallel gearbox

Parallel gearbox consists of one housing which fits on one side to the linear unit and on the other side to the motor adapter with the matching coupling. The coupling is already mounted on the input shaft of the gearbox and locked by a screw. The counterpart of the coupling is delivered with the motor adapter.

The parallel gearbox transmits the motor torque through three stage spur gear directly to the linear unit (max. output torque 300 Nm). Three gear ratios are available and it is maintenance free.

### Technical data

Gearbox type		CAM-GS-CBA-XX	CAM-GS-CCA-XX	CAM-GS-CDA-XX
Short designation	Unit			
Type	–	Parallel	Parallel	Parallel
Gear reduction	–	3,89	9,82	24,95
Nominal output torque	Nm	100	100	100
Max. output torque	Nm	300	300	300
Max. input power	W	3 000	3 000	3 000
Max. input speed	r/min	4 500	4 500	4 500
Efficiency	%	85	85	85
Weight	kg	9	9	9
Length	mm	98,5	98,5	98,5

### Manual override

The parallel gearbox has a manual override as built-in functionality. The gearbox can be manually operated through a hexagonal key located on the gearbox motor axis. As standard, the access to this key is covered by a plate (→ fig. 1). On request, it's possible to have a round opening for direct access (→ fig. 2) or to mount an electromagnetic brake (→ fig. 3).

### Speed limiting centrifugal brake

When safety is non-negotiable, a centrifugal brake (→ fig. 4) can be a useful device. It is recommended together with an electro-mechanical brake on the motor. When releasing such a brake, the applied load may cause a rapid retraction of the machine, if no centrifugal brake is used. A centrifugal brake can be adjusted to the application in order to limit the retracting speed to a safe value. The centrifugal brake is mounted similar to an electromagnetic brake (→ fig. 3). The following table give parameters example:

Engagement speed	n_eng	2 200 rpm ± 150 rpm
Torque	Tk	10 Nm @ 2 800 rpm ± 150 rpm

## Examples of linear unit, parallel gearbox and IEC AC motor combinations

The table below is a guidance to understand the performance levels that can be reached by using CAM-GS gearbox with standard IEC AC asynchronous motors, in terms of maximum dynamic axial force and linear speed.

In particular, by selecting the desired force and speed range, it's possible to quickly see which combination of screw, gearbox and asynchronous AC motors fulfil the application needs. This is a generic guidance, while the detailed performance values of each mentioned combination should be calculated.

## IEC AC Motors

The Siemens SIMOTICS low-voltage electric motors provided by Ewellix comes with a holding brake and PTC thermistor as standard.

It is a SIMOTICS GP 1LE1 self-ventilated aluminium motor with standard terminal box.

In addition, the motors are equipped with a two channel rotary pulse encoder as feedback.

Motor type <sup>1)</sup> Designation	Size	Type	Rated power kW	Rated speed RPM	Rated current A	Rated torque Nm	Efficiency level	Motor weight kg	Motor inertia kgm <sup>2</sup>	Brake inertia kgm <sup>2</sup>

<sup>1)</sup> Voltage 400 VΔ, 50Hz

## Example

Selected performance values

- Max dynamic axial force: = 34 kN
- Linear speed: = 11 - 20 mm/s

Resulting combination

- Gear reduction: 24,95
- Screw type: Ball screw or roller screw
- Screw diameter: 40 mm (ball screw) or 30 mm (roller screw)
- Screw lead: 10 mm
- Motor type: Asynchronous AC
- Motor size: A63

## Complete actuator combinations

The built-in modularity of the CASM-100 actuator allows customers to create tailor-made solutions through a vast number of standard components.

Considering the different types and sizes of screws, gear-boxes, motors, push tubes, bearing units, sealing kits and attachments available, several hundreds of combinations are possible.

Each of them can deliver a unique performance to fulfill even the most demanding application requirements.

For that reason, the following pages are presenting data-sheets only or the linear units for one of the possible actuator combinations (i.e. linear units with 4 screws - inline adapter - servo motors), as an example.

To create the optimal actuator combination for your application, the CASM-100 configurator is the best supporting tool. The software is available on Ewellix website in the section CASM-100 CONFIGURATOR.

Ambient temperature	$T_{ambient}$	°C	–20...+50	–20...+50	–20...+50	–10...+50
Max. humidity	$\phi$	%	95	95	95	95
Degree of protection	IP	–	54S	54S	54S	54S

<sup>1)</sup> Buckling limitation for long strokes, also limited by accessories and configurations. Please check the CASM-100 configuration tool on ewellix.com

<sup>2)</sup> Maximum dynamic axial force usable to apply the theoretical lifetime calculation (L10)

<sup>3)</sup> Preferred stroke range:

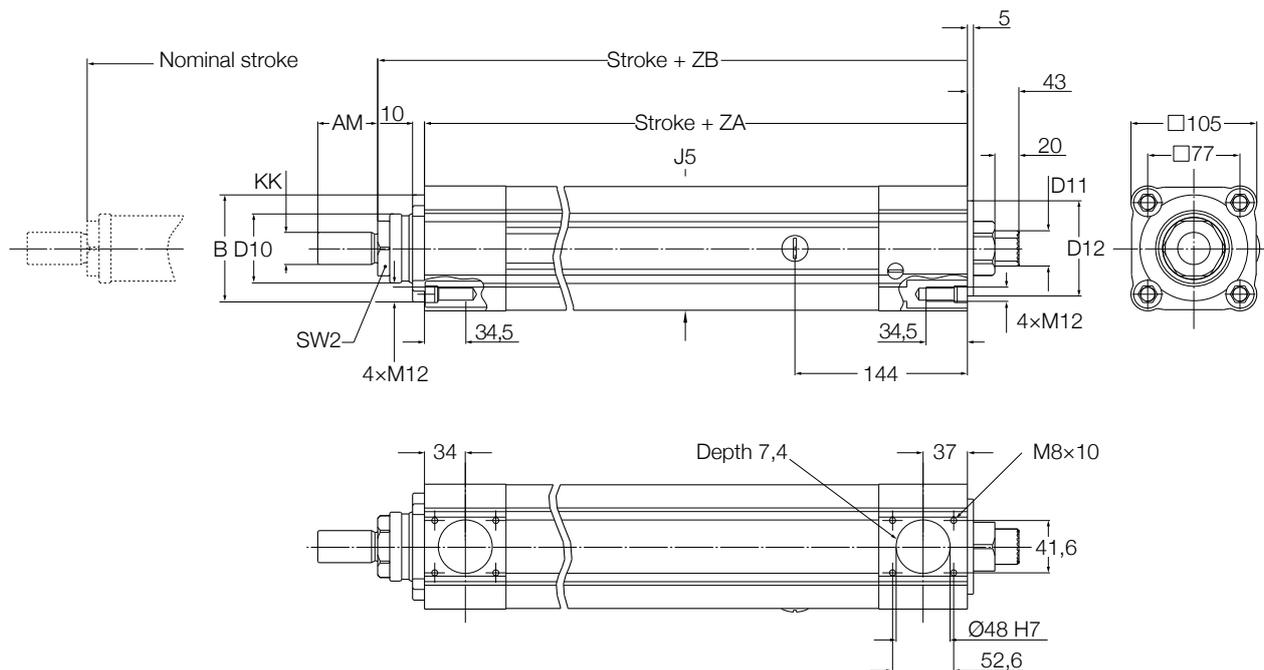

from 50 to 1 000 mm stroke is by 50 mm step (50, 100, 150, ..., 900, 950, 1 000)

from 1 000 to 2 000 mm stroke is by 100 mm step (1 100, 1 200, ..., 1 900, 2 000, valid for BA, BB and BC screw type excluding RA one)

For all other strokes, out of the preferred range, consider an additional 1 week on standard leadtime. Please contact Ewellix

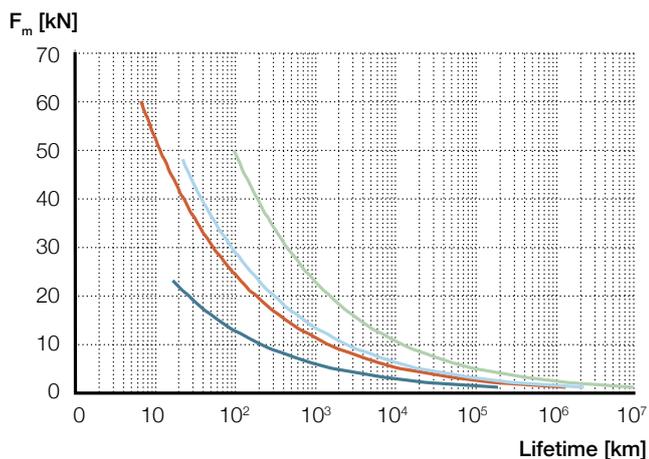

<sup>4)</sup> On CASM-100-RA and stroke > 1000 mm, please contact Ewellix

See page 148

# Options

The following parts are available as options and can be ordered directly through the typekey. It is not necessary (but optional) to order as extra lines if already configured and selected in the typekey.

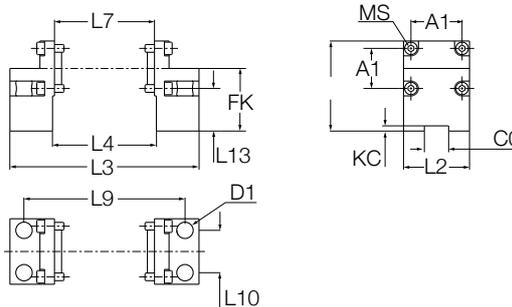

## Front Plate

**Ordering key**  
ZBE-377918

Type	MS	L <sub>1</sub>	L <sub>2</sub>	L <sub>3</sub>	L <sub>4</sub>	D <sub>1</sub>	D <sub>5</sub>	D <sub>2</sub>	L <sub>6</sub>	m
-	-	mm								kg
ZBE-377918	M12 × 40	165	109	140	77	Ø13,5	□ 77	Ø90	25	2,1

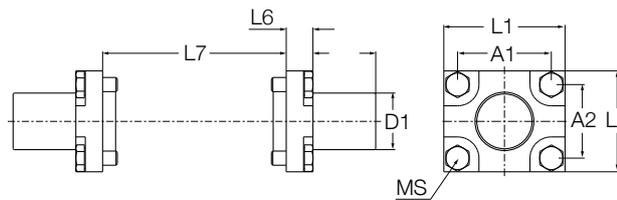

## Foot Mount

**Ordering key**  
ZBE-377920

Type	MS	L <sub>1</sub>	L <sub>2</sub>	L <sub>3</sub>	L <sub>4</sub>	L <sub>7</sub>	FK	A <sub>1</sub>	A <sub>2</sub>	L <sub>9</sub>	L <sub>10</sub>	KC	C0	L <sub>13</sub>	D <sub>1</sub>	m
-	-	mm														kg
ZBE-377920	M8 × 20	93,5	68	194,8	107	103	65	52,6	41,6	165,8	44	5,4	25	50	Ø17	2,8

## Mounting kits Pivot Attachment

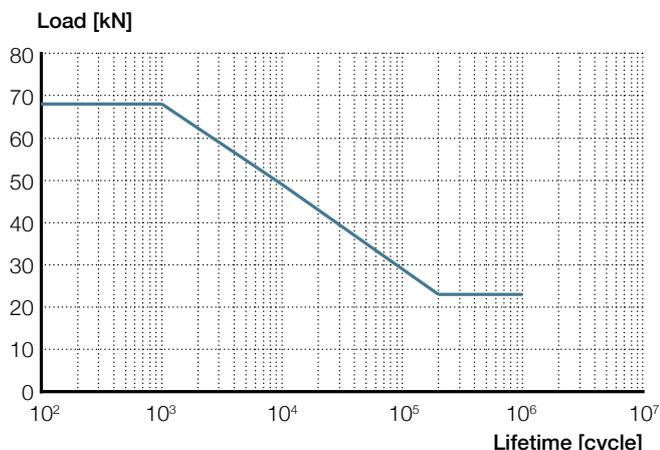

**Ordering key**  
ZBE-377919

Type	MS	L <sub>1</sub>	L <sub>2</sub>	A <sub>1</sub>	A <sub>2</sub>	L <sub>5</sub>	L <sub>6</sub>	L <sub>7</sub>	D <sub>1</sub>	m
-	-	mm								kg
ZBE-377919	M8 × 18	68	57	52,6	41,6	35,2	15	103	Ø32	1,5

## Pivot attachment

Load rating and lifetime limitation on the pivot mount, see graph below.

## Ingress protection

The linear unit is available with the following ingress protection options (note that IP ratings are valid if the bearing housing is sealed by Ewellix gearbox or others with similar sealing performances):

### Option B: IP54S

Protected against dust and water spray if standing still.

### Option C: IP65 with sinter filter

Requiring sinter filter to be protected from dust and water. As a consequence it is required to face sinter filter downwards to protect it from rain. If not possible to protect the sinter filter, and to ensure ingress protection level, please take option D (see below).

In addition, and due to the use of solid oil ring and single lip wiper on the front, performances are restricted to avoid premature wear on the sealing. It restricts performances to the following:

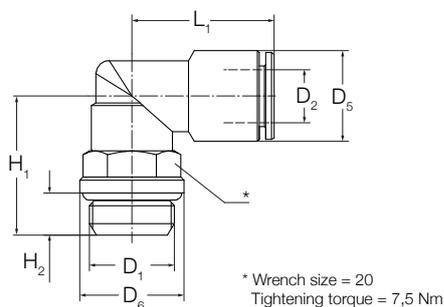

Max linear speed	Vmax	35 mm/s
Lifetime distance driven	L	100 km

### Option D: IP65 with hose

If selected, a dedicated interface valve is provided and mounted on the linear unit, allowing the actuator to breath. A hose (not provided by Ewellix) need to be connected to this interface valve in order to supply it with clean air.

It still restricts performances as indicated for Option C.

## Interface valve

### G thread with sealing ring

Connections	Tubing O.D.						Weight/ piece
D1	D2	D5	D6	H1	H2	L1

Linear unit

C A S M - 1 0 0 - B C - 0 1 0 0 - A A 0 C 1 0 A - B A 1 1 0 0 - 0 0 0

Size

Screw type

- BA Ball screw 32 × 10
- BB Ball screw 40 × 10
- BC Ball screw 40 × 20
- RA Roller screw 30 × 10

Stroke

- Stroke in mm

Push tube

- A E355 chrome plated, Ø55

Front housing and attachments

- A Aluminium, no mounting option
- B Aluminium, with body attachment

Front housing attachment

- 0 None
- A Front plate 90° mounting position
- B Front plate 0° mounting position
- C Pivot attachment (trunnion brackets to be ordered separately)
- D Foot mount, 0° mounting position
- E Foot mount, 180° mounting position

Rear housing

- A1 Aluminium, no mounting option, reduced static load, for screw type BA<sup>1)</sup>
- B1 Aluminium, no mounting option, reduced static load, for screw type BA<sup>1)</sup>
- C1 Aluminium, no mounting option, for all screw types
- D1 Aluminium, prepared for pivot or foot mounting, for all screw types

Rear housing attachment

- 0 None
- C Pivot attachment (trunnion brackets to be ordered separately)
- D Foot mount, 0° mounting position
- E Foot mount, 180° mounting position

Protection tube

- A Aluminium, 90°, recommended for parallel
- B Aluminium, 180°
- C Aluminium, 270°
- D Aluminium, 0°, recommended for inline

<sup>1)</sup>Maximum static axial force limited to 31 kN

### Mounting positions

For a complete actuator assembly, the gearbox is used as the 0° reference for all connected modules (↳ fig. 6).

Fig. 6

Gearbox reference

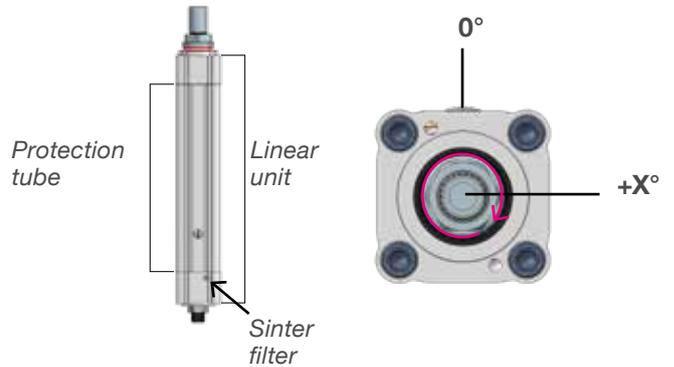

### Mounting position protection tube

The 0° reference for the protection tube is the sinter filter position. The protection tube can be turned in 90° steps clockwise (↳ fig. 7). Parallel gearbox mounting positions have some limitations: protection with relubrication port can be mounted at 90° - 180° - 270° (0° is not possible) (↳ fig. 8).

Fig. 7

Linear unit reference

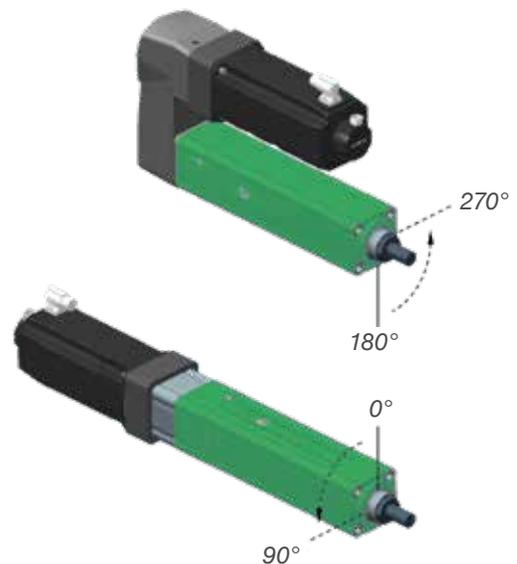

### Orientation recommendation

For parallel version, recommended linear unit mounting position is 0° and protection tube mounting position is 90° (270° also possible).

Fig. 8

Linear unit orientation

## Mounting positions motor

The 0° reference for the motor is the electric connector outlet position. The motor can be turned in 90° steps clockwise (↳ **fig. 9**). Parallel gearbox mounting position have some limitations: Motor from sizes Servo 8x / IEC AC 80 and bigger can be mounted at 0° - 90° - 270° (180° is not possible) (↳ **fig. 10**).

Fig. 9

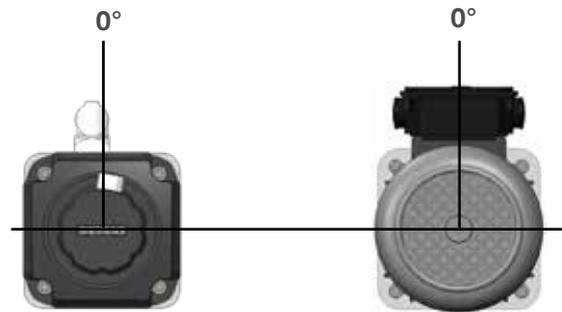

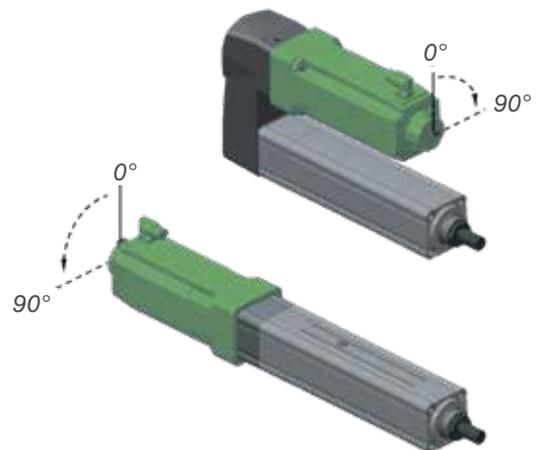

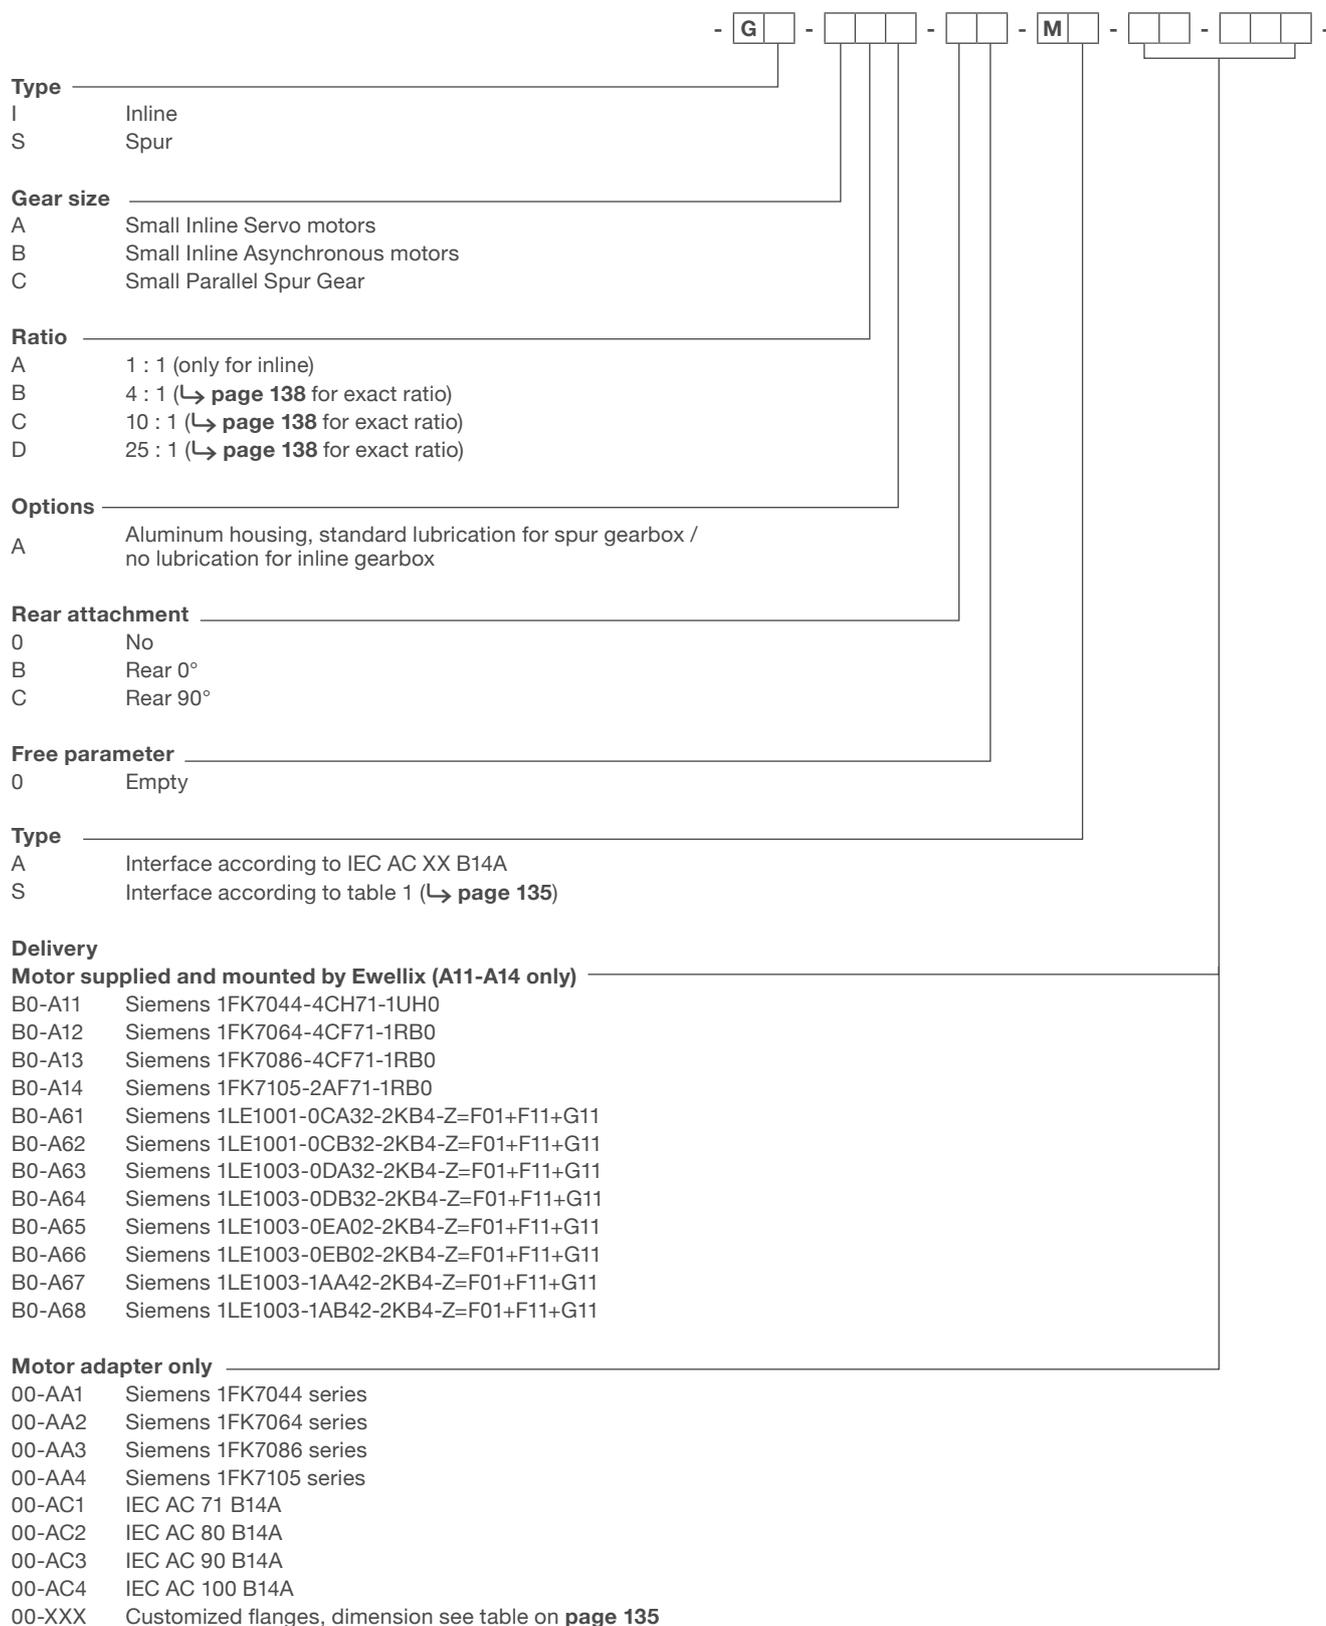

*Reference motor adapter*

Fig. 10

*Motor adapter orientation*

**Mounting position linear unit**

- A 0°, recommended for parallel (standard if no gearbox is selected)
- B 90°
- C 180°
- D 270°

**Mounting position motor**

- 0 no motor kit selected
- A 0°
- B 90°
- C 180° (Inline Gearbox only)
- D 270°

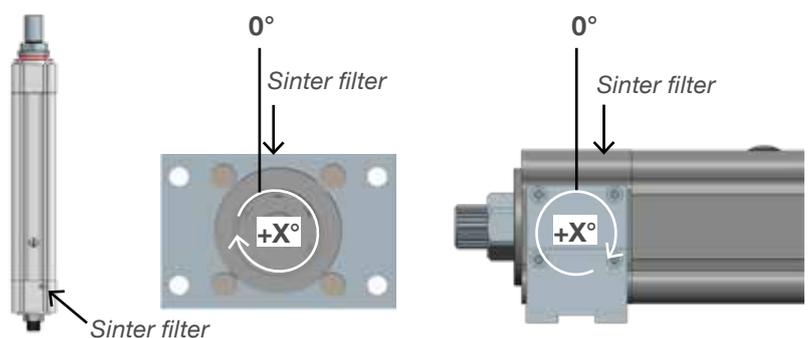

**Customer option**

- 000 No option

Fig. 5

**Mounting position front plate and foot mount**

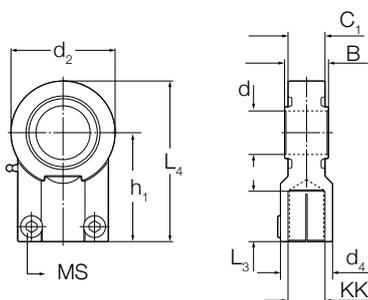

The 0° reference for the linear unit is the sinter filter position. The front plate can be turned in 90° steps clockwise. The foot mount can be turned in 180° steps clockwise.

# Electric cylinders

## LEMC

### Features

- High performance roller screw
- Steel push tube and aluminium protection tube
- Modular concept
- Possible to relubricate the roller screw nut with direct access
- Servo motors, asynchronous motors and customized motor adapters

### Benefits

- High load and lifetime capacity, as well as high acceleration and speed capabilities
- High stiffness and robustness
- Multiple combinations allow for use in wide range of applications
- Low maintenance requirements
- Optimal solution for a wide variety of applications, either with Ewellix-provided motors or with the motor of your choice

## Product description

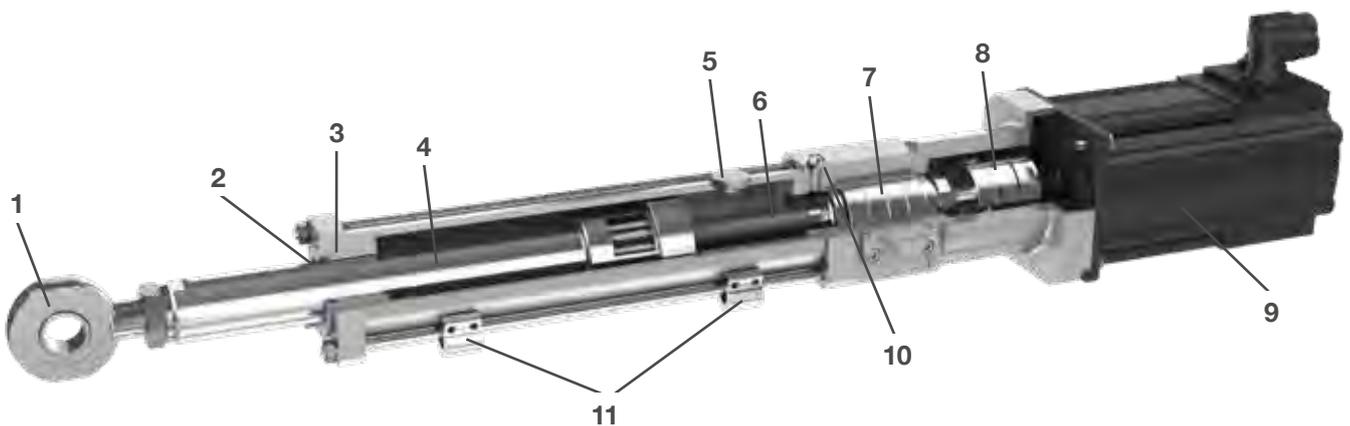

For generations, hydraulic cylinders were often the first choice for large forces or to move heavy loads. Today, hydraulic systems have a powerful rival in the linear motion world – the electric cylinder.

In many applications, electromechanical systems provide a host of advantages over their hydraulic counterparts. They are smaller and lighter, and since the motor powering the actuator is connected directly, electromechanical systems do away with bulky pumps, accumulators, oil tanks and pipework. The absence of pressurised oil has safety and environmental benefits too, minimizing the risk of fire, pollution or injury associated with leaks and spills.

LEMC electric cylinders replace hydraulic systems with a precision roller screw, driven by a locally mounted electric motor and gearbox.

This technology results in an actuator with a higher power density than conventional designs. LEMC actuators use a modular design that can be configured for many different applications and a range of motor types.

In addition to conventional servo motors, they can be supplied with an integrated gearbox and smart asynchronous motor. This provides additional safety and machine protection capabilities, with integrated soft start and motor protection functions. As a further benefit for operations and maintenance staff, the controller incorporates near field communication (NFC) capabilities, allowing it to be adjusted wirelessly using a smartphone.

1. Rod end
2. Scraper to keep out contaminants
3. Guiding bushing
4. Steel push tube and aluminium protection tube
5. Re-lubrication access
6. High quality Ewellix planetary roller screw for highest axial loads with low play and high efficiency
7. High quality SKF bearings
8. Coupling
9. Servo motor or Asynchronous motor
10. Sinter filter for high airflow
11. Adjustable Home and limit switches

## Motors and gearboxes

### Servo motors

The LEMC can be ordered with a servo motor. In this case, Ewellix has selected a series of Lenze motors and drives that best matches the performance of the actuator to the end-user application. To complete the design, several options can be selected such as absolute encoder (EnDat, Hyperface), safety brake or associated servodrive. It is also possible to equip the LEMC with your preferred brand of servo motor so that it integrates best into your system. Please contact Ewellix to check the feasibility of your configuration.

For more information please visit the following sites:

**Motors:**

<http://www.lenze.com/en-us/products/motors/>

**Drives:**

<http://www.lenze.com/en-us/products/inverters/>

### Drive options

The performance attributes shown in the table on the previous page are the result of specific Lenze servo motor and drive combinations. The LEMC can be offered with or without the servodrive. The servo-drive can be in the recommended configuration or any other configuration that fits your installation.

In the case of a different combination, please contact Ewellix to determine what effect the different configuration will have on the performance of the actuator.

## Asynchronous motors

The LEMC with asynchronous motor is the combination of an LEMC linear unit, a gearbox and a Lenze smart asynchronous motor. The gearboxes are available with several ratios to either favor speed or load for any linear unit size. They are available packaged in parallel and right angle configurations. The gearboxes are oil lubricated. When ordering a LEMC with asynchronous motor, the proper configuration must be identified so that the drains and vents are located correctly.

## Smart functions

The asynchronous Lenze motor is equipped with a smart control box with the following features:

- Rotating speed can be adjusted freely between 500 and 2 600 r/min
- 3 digital inputs for changing speed and direction of movement
- 1 digital output for status message
- Integrated ramps for soft start and stop functions, to protect the system mechanics and full motor protection
- Less wiring thanks to electronic contactor and motor protection function
- Excellent energy efficiency
- Can be operated with an NFC-capable smartphone

## Parallel gearbox

Parallel gearbox consists of one housing which fits on one side to the linear unit and on the other side to the motor adapter with the matching coupling. The coupling is already mounted on the input shaft of the gearbox and locked by a screw. The counterpart of the coupling is delivered with the motor adapter.

The parallel gearbox transmits the motor torque through three stage spur gear directly to the linear unit (max. output torque 300 Nm). Three gear ratios are available and it is maintenance free.

### Technical data

Gearbox type		CAM-GS-CBA-XX	CAM-GS-CCA-XX	CAM-GS-CDA-XX
Short designation	Unit			
Type	–	Parallel	Parallel	Parallel
Gear reduction	–	3,89	9,82	24,95
Nominal output torque	Nm	100	100	100
Max. output torque	Nm	300	300	300
Max. input power	W	3 000	3 000	3 000
Max. input speed	r/min	4 500	4 500	4 500
Efficiency	%	85	85	85
Weight	kg	9	9	9
Length	mm	98,5	98,5	98,5

### Manual override

The parallel gearbox has a manual override as built-in functionality. The gearbox can be manually operated through a hexagonal key located on the gearbox motor axis. As standard, the access to this key is covered by a plate (↳ fig. 1). On request, it's possible to have a round opening for direct access (↳ fig. 2) or to mount an electromagnetic brake (↳ fig. 3).

### Limit/Home switches

Sensor type: magnetic

Technology: DC PNP

Limit switch to output: normally closed

Home switch output: normally open

Supply voltage (V DC): 24 V

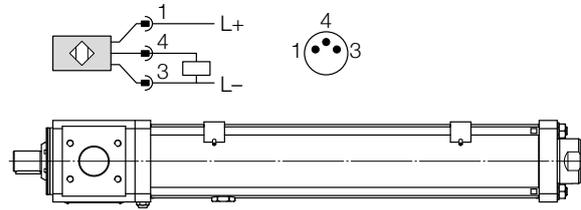

Consumption (mA): < 10 (under 24 V DC)

Max current output (mA): 100

Connection: M8×1 plug

Cable length PUR 0,3 m

The location of the home and limit switches can be adjusted easily on the linear unit.

# Electric cylinders

## CEMC

### Features

- Very compact, fully integrated design
- Inverted roller screw
- Lightweight material
- Highly efficient
- High-resolution position feedback system
- High-speed and acceleration capabilities
- Low maintenance requirements
- High quality components

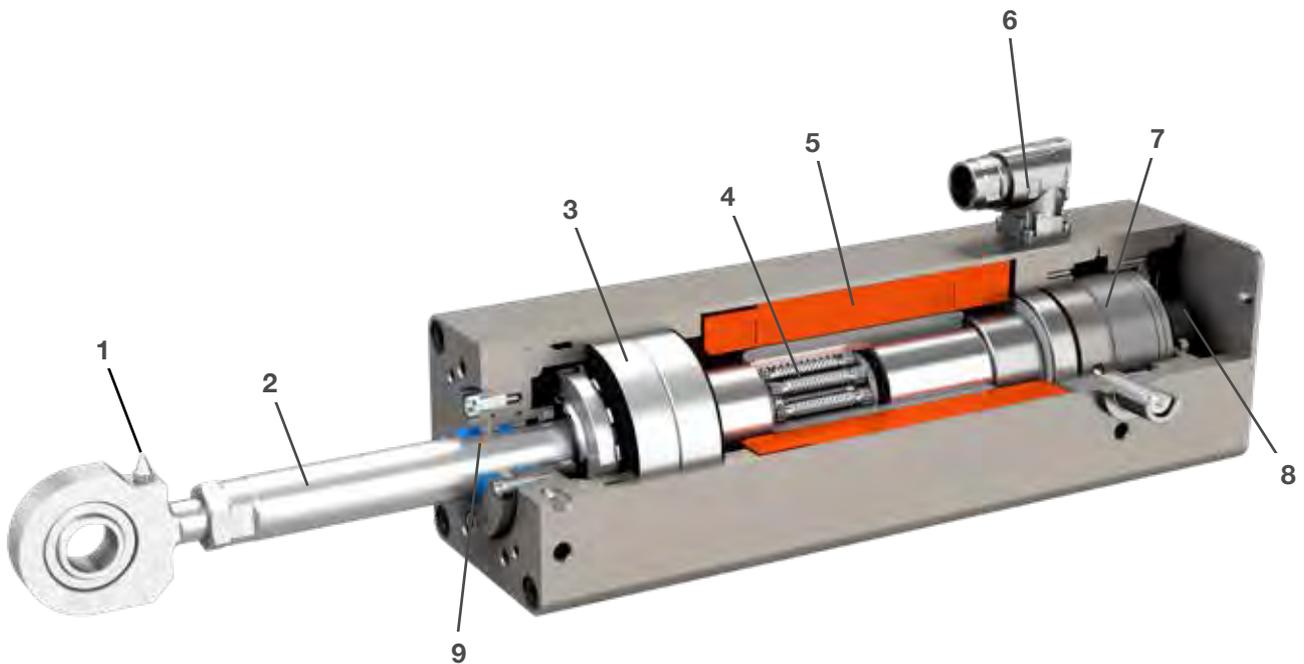

### Benefits

- Saves space
- Very high load capabilities compared to actuators with similar dimensions
- Enables for higher acceleration and higher speed of the robot arm
- Reduces energy consumption by 90% compared to pneumatic solutions
- Better quality through greater control of the process
- Faster production cycles
- Low noise

## Product description

The GEMC actuators incorporate the planetary inverted roller screw technology that allows integration of hollow shaft motor directly on the roller screw nut, resulting in a very compact yet powerful solution. Besides dimensions, this design also minimize inertia, thus allowing excellent control, responsive performance, significantly improved cycle time, and high productivity.

This product range provides high power density in a small package, with approximately 50% shorter length than any typical electromechanical cylinder. They are an ideal solution when compactness and power density are needed to replace fluid powered cylinders. Moreover there is the added advantage of reduced weight, an important feature for robot arms installations.

1. Lubrication nipple
2. Push tube
3. High quality angular contact ball bearings
4. High quality planetary inverted roller screw for highest axial load rating, low axial play and high efficiency
5. Integrated hollow shaft servo motor
6. Motor connectors
7. Fail safe brake option
8. Position feedback options for compatibility with main brands of robots/controllers
9. Scraper seal to keep contamination out

## Automotive industry

The automotive industry uses a large quantity of industrial robots with an average of 300 welding robots per production line. The CEMC is the best solution to meet the quality standards, performance requirements and energy savings.

With 20 years of automotive experience, the next generation CEMC anticipates future market requirements by offering multiple configurations to fit customer needs and to provide the best performances on the field. Upcoming options such as integrated anti-rotation and embedded IoT-ready sensors will further improve equipment performance and productivity.

### CEMC feedback

CEMC next generation is available with different types of position feedback sensors, to ensure the compatibility with main robot and drive manufacturers.

## Key benefits for spot welding

	Value	vs previous generation
 Highest number of welding spots	> 20 million spots	+100 %
 Lightweight construction to reduce welding robot power and size	12,5 kg	-10 %
 High reliability to minimize downtime	10 million spots without relubrication	+500 %
 Modularity with various feedback options	336 configurations	Limited feedback options

x5N Axial force [kN]

$F_{cont}$   $F_{peak}$

### Lifetime diagram

Fm [N]

**NOTE:**

This curve shows standard L10 fatigue calculation, with a mean load over a double stroke cycle. For applications like spot welding or servo press, where a peak force is applied over a very short stroke (shorter than twice the pitch of the roller screw), standard L10 fatigue calculation is not representative of the reachable life in operation. In these cases, please contact Ewellix for a dedicated service life calculation.

F<sub>cont</sub> F<sub>peak</sub>

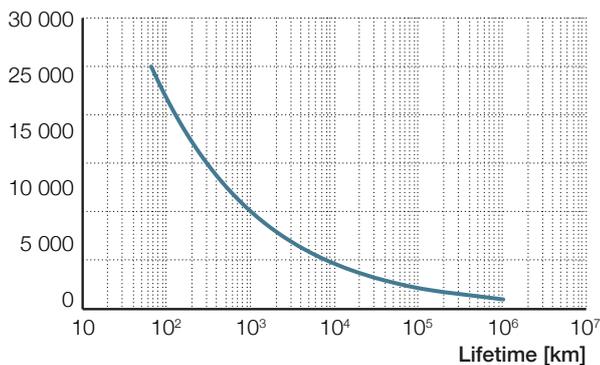

x5N Axial force [kN]

F<sub>cont</sub> F<sub>peak</sub>

### Lifetime diagram

F<sub>m</sub> [N]

**NOTE:**

This curve shows standard L10 fatigue calculation, with a mean load over a double stroke cycle. For applications like spot welding or servo press, where a peak force is applied over a very short stroke (shorter than twice the pitch of the roller screw), standard L10 fatigue calculation is not representative of the reachable life in operation. In these cases, please contact Ewellix for a dedicated service life calculation.

### Ordering key

See page 228

## Feedback range on CEMC

### Drive compatibility

Robot or drive manufacturer	Resolver Tamagawa (R1)	Resolver LTN (R2)	Absolute encoder Sick-Stegmann (S1)	Absolute encoder Heidenhain (H1)	Absolute encoder Fanuc (F1)	Absolute encoder Yaskawa (Y1)

## Drive options

The performance attributes shown in the tables on the previous pages are the result of a specific Lenze servodrive combinations with the CEMC and integrated Ewellix motor.

The CEMC can be offered with or without the servodrive. The servodrive can be in the recommended configuration or any other configuration that fits your installation with various fieldbus communication for instance (↳ **table 1**).

Standard motors used by Ewellix is powered with 3 × 400VAC drive voltage supply. In consequence standard configurations with Lenze servodrive are with Axx motor type and winding.

Please refer to the ordering key (↳ **page 228 and 229**).

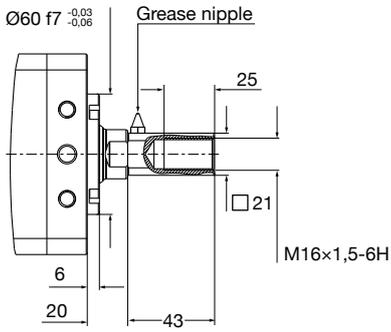

**Table 1**

Linear unit	Motor reference	Lenze drive ref.
CEMC2105-180-...	A3N	E94ASHE0074
CEMC2105-180-...	A5N	E94ASHE0134
CEMC2105-180-...	A3W	E94ASHE0134
CEMC2105-180-...	A5W	E94ASHE0174

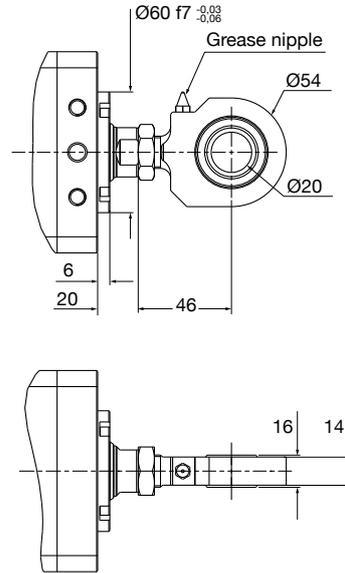

**NOTE:** Please refer to Lenze documentation for more information. <http://www.lenze.com/en-us/products/inverters>

### Optional front and rear attachment drawings

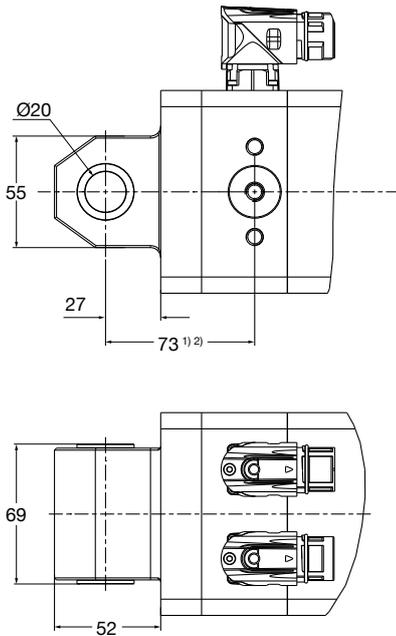

#### Female thread

#### Rod end

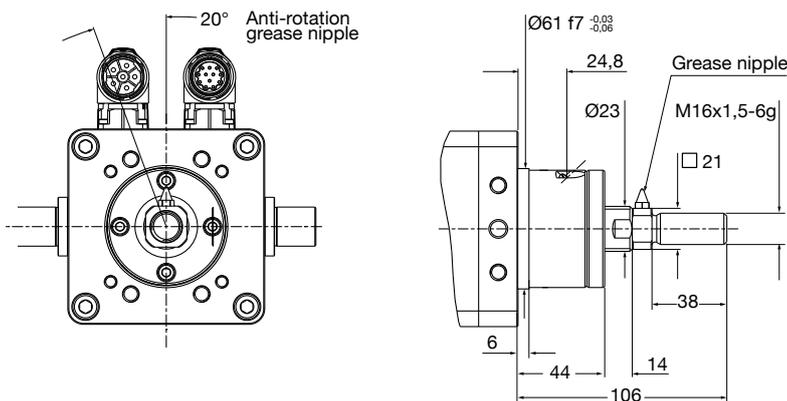

#### Back clevis

- <sup>1)</sup> For brake option, add 44 mm
- <sup>2)</sup> Additional length varies depending on the type of feedback device: for R1, R2 and S1 is 73 mm as shown, and for H1 add 25 mm

**NOTE:** For other feedback options, please contact Ewellix.

### Optional anti-rotation drawing

**NOTE:** With anti-rotation option, please consider an added weight of 0,7 kg to the linear unit.

**Drive manufacturer and family**

- L1 Lenze 9400
- S1 Siemens Sinamics S120
- K1 Kuka
- C1 Comau
- A1 ABB
- F1 Fanuc
- Y1 Yaskawa
- P1 Parker Compax3

If other drive used, please contact Ewellix for coding

**Feedback**

- R1 Standard resolver (Tamagawa)
- R2 Resolver (LTN)
- S1 Sick absolute encoder
- H1 Heidenhain absolute encoder
- F1 Fanuc absolute encoder <sup>1)</sup>
- Y1 Absolute encoder compliant to Yaskawa specification <sup>1)</sup>

**Free coding (options)**

**Motor drive (only valid if L1 selected previously)**

- Y Drive included
- N No drive

**Power and signal cables**

- 1 5 m
- 2 10 m
- 3 15 m
- 4 20 m
- N no cable

**Drive fieldbus**

- A CanOpen
- B Devicenet
- C Ethercat
- D Ethernet
- E Powerlink MN/CN
- F Powerlink CN
- G Profibus
- H Profinet
- N No fieldbus

**Customization code**

For a complete system with Lenze servodrive (valid only with -Axx- motor range), please select options as shown in red in ordering key. If no Lenze servodrive requested, please indicate only -NNN-. See example below.

**Example**

**Linear unit only**

CEMC2105-180-TRN-A5N-BA1R2x-NNN-00

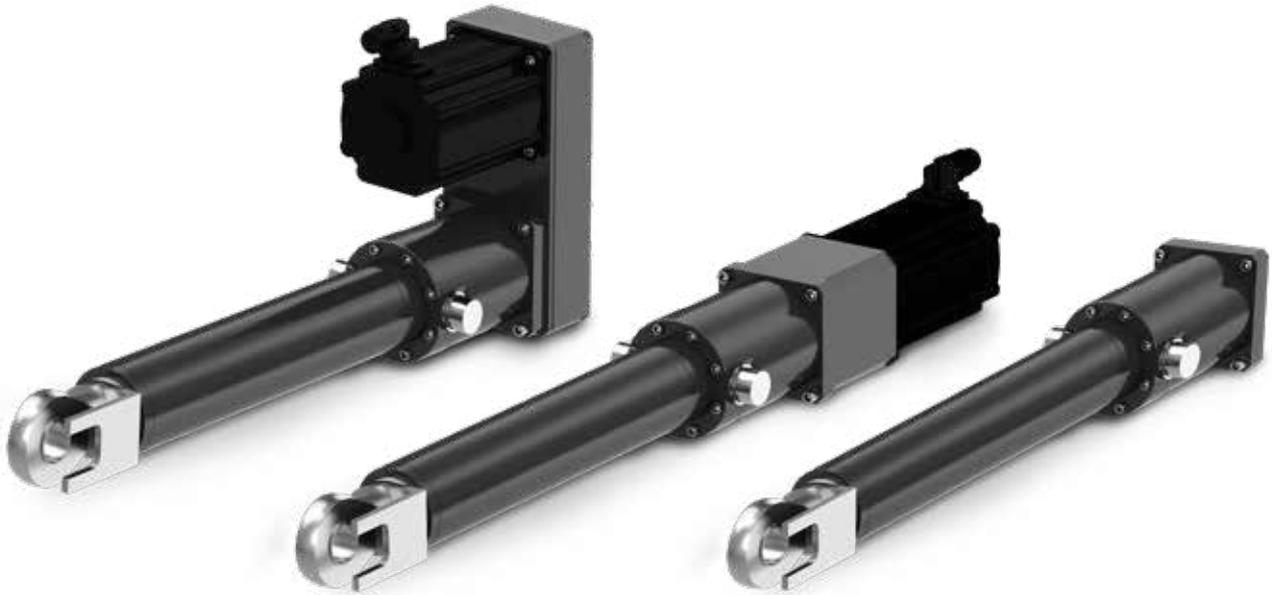

**Complete system, with actuator + Lenze servodrive:**

CEMC2105-180-TRN-A5N-BL1R1x-Y2G-00

<sup>1)</sup> Available on request. Please contact Ewellix.

# Electric cylinders SRSA and SVSA

## Features

- High performance roller screw
- Steel push tube and protection tube
- Modular concept
- Anti-rotation with profile rail guide
- Possibility to re-lubricate the roller screw nut with direct access
- Optional low lead roller screw or high-lead ball screw available.
- Brushless servo motors and customized motor adapters

## Benefits

- High load with long life capacity as well as high acceleration and speed capabilities
- High stiffness and robustness
- Multiple combinations to fit a wide range of applications
- Extreme push tube torque resistance
- Low maintenance requirements
- Optimal solution for a wide range of applications where high load, high positioning accuracy or high speed is needed.

## Product description

Electric cylinders SRSA are a straight forward combination of Ewellix's high quality planetary roller screws, SKF's angular contact ball bearings that will hold load and servomotors so they can perform highly efficient linear movements with full controllability. The SRSA housing is made of steel for high stiffness and robustness. The wide range consists of cylinders with screw sizes from 39 mm up to 75 mm. This enables the use of electric SRSA cylinders in applications with peak forces up to 500 kN, where – in the past – only hydraulic cylinders were an option.

For long strokes, the free end of the screw shaft is supported and guided inside the push-tube to prevent any vibration.

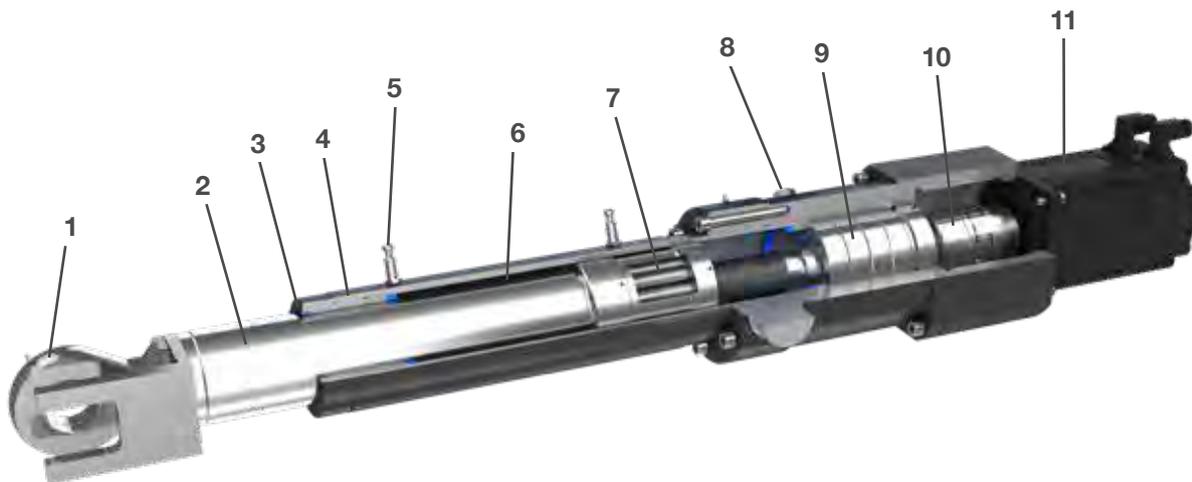

The optional anti-rotation device is made of profile rail guides. This pre-loaded design provides very high torsional stiffness and durability.

Two internal bumpers secure the mechanism during the adjustment phase, protecting the screw nut from damage due to impact with the mechanical end stops.

For very high positioning accuracy, Ewellix offers the slow moving SVSA range with high precision recirculating roller-screws. Thanks to the very short screw lead of 1 mm only, it is easier to control the actuator while doing fine positioning adjustments.

To cover the high speed applications as well, Ewellix equipped the SLSA versions with high lead ball screws. Those cylinders provide fast acceleration and speeds up to 1,5 m/s thanks to the long screw lead of up to 40 mm (see customization solutions).

The full range of SRSA and SVSA is available in inline configurations as well as in parallel configurations to fit most applications.

1. Rod end
2. Steel push tube
3. Scraper seal to protect against contaminants
4. Guiding bushing
5. Home and limit switches
6. Steel protection tube
7. High quality Ewellix planetary roller screw for highest axial loads with low play and high efficiency
8. Sinter filter for high airflow
9. High quality SKF angular contact ball bearings
10. Coupling
11. Servomotor

## Motors and gearboxes

### Servo motors

The SRSA can be ordered with a servo motor. In this case, Ewellix has selected a series of Lenze motors and drives that best matches the performance of the actuator to the end-user application. To complete the design, several options can be selected such as absolute encoder (EnDat, Hyperface), safety brake or associated servodrive. It is also possible to equip the SRSA with your preferred brand of servo motor so that it integrates best into your system. Please contact Ewellix to check the feasibility of your configuration. For more information, please visit the following sites:

**Motors:**

<http://www.lenze.com/en-us/products/motors/>

**Drives:**

<http://www.lenze.com/en-us/products/inverters/>

### Drive options

The performance attributes shown in the table on the previous page are the result of specific Lenze servo motor and drive combinations. The SRSA can be offered with or without the servodrive. The servodrive can be in the recommended configuration or any other configuration that fits your installation.

In the case of a different combination, please contact Ewellix to determine what effect the different configuration will have on the performance of the actuator.

## Customized solutions

Up to 65% weight saving  
Up to 100mm/s high speed  
pillars

# Servo pillar CPSM

## Features

- High dynamic servo or brushless DC motor for high speed up to 100 mm/s
- High performance ball screw for high load capacity up to 5 kN
- Extruded aluminum profiles for a very robust design
- Manually adjusted gliders for very high stiffness and high eccentric loads
- Encoder system of the motor and high quality gearbox enable high positioning accuracy and high repeatability (0,1 mm)

## Benefits

- High nominal power of the motor allows for high duty cycle of the pillar
- Customized motor adapter for highest flexibility (max. motor diameter 90 mm)
- Customized top and bottom plate to fit most of the applications
- Customized aluminum profile colour (anodized) to fit application design needs
- Optional brake to release the motor when it's in position and to increase the duty cycle
- Preloaded bearing arrangement also for ceiling mount applications (only available without damping system)

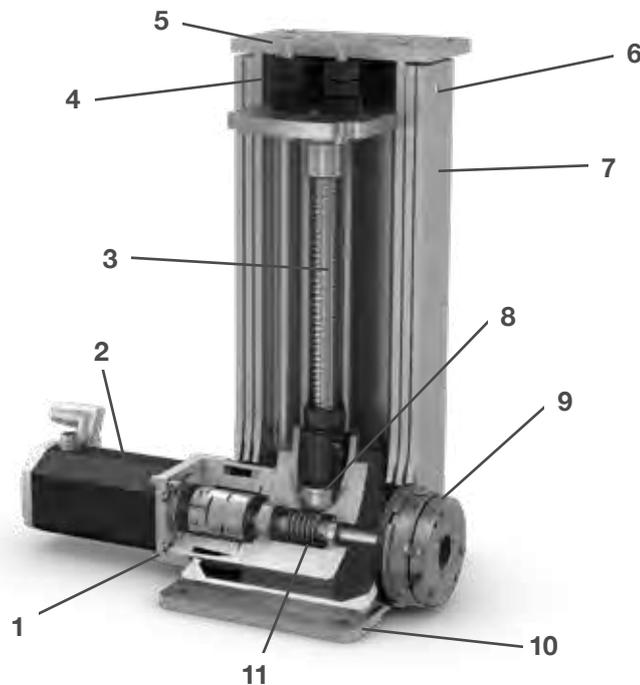

## Product description

Telescopic pillars CPSM are the ideal solution to combine strong guiding functions with linear movements.

The robust, manually adjusted and virtually backlash-free aluminum extrusions are able to carry high excentric loads in push and pull directions.

To provide enough power to lift and lower heavy weights with high speed, the pillars are equipped with brushless DC or servo motors. Of course, Ewellix also supports the usage of preferred motors with a customizable motor interface.

Optional brakes and damping elements are key features that allow an effective usage in heavy duty industrial applications.

1. Standard or customized motor interface
2. Motor (Brushless DC or servo AC)
3. High efficiency ball screw
4. Optional damping system
5. Customized top plate
6. Backlash-free long lasting guiding pads
7. 2 or 3 section extruded aluminum guiding tubes
8. Preloaded bearing arrangement
9. Optional electromechanical brake
10. Customized bottom plate
11. Low friction worm gear reduction

# Servo actuator SEMC

## Features

- High performance roller screw for high speed (up to 600 mm/s) and acceleration (up to 9,5 m/s<sup>2</sup>) requests
- High dynamic servomotor for high speed and acceleration requests
- Optional anti-rotation device
- Adjustable external proximity switches
- Optional lubricant for food grease compatibility
- Optional fail safe brake, absolute encoder on servomotor
- Recirculation roller screw with low lead (up to 1 mm) available on demand

## Benefits

- Long lifetime, thanks to roller screw technology
- Aluminium body to save kg and limit total weight of the actuator
- Customized motor adapter for highest flexibility (max motor section 90 mm)
- Compact solution with high power density

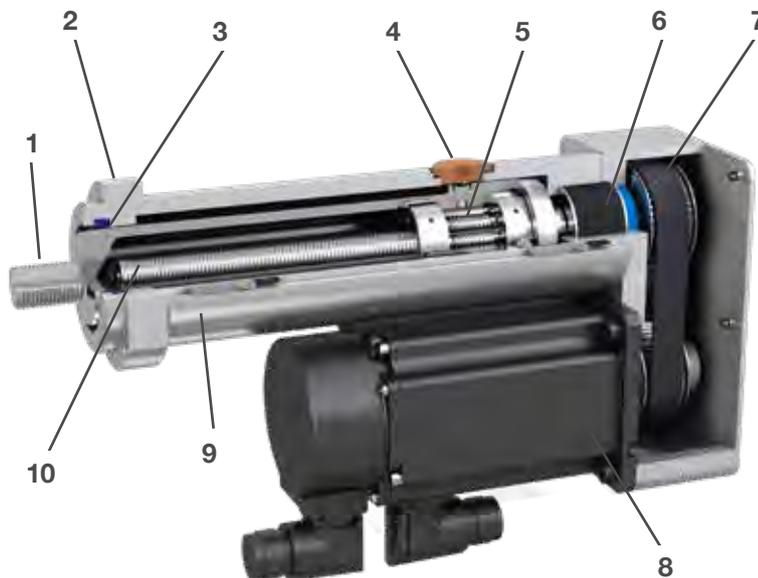

## Product description

In addition to standard electrical cylinder product range, Ewellix offers an extensive customization program that is able to fulfill specific application needs. This is important for Ewellix recognition as a knowledge engineering company and solution provider.

The SEMC actuator is one of the customized solutions designed by Ewellix. The application requirements consisted of

a dimensionally compact and lightweight actuator with a long lifetime, high speed and high acceleration.

The Ewellix solution is based on a BRC15 × 5 or 8 roller screw, with a full aluminium body, resulting in a very compact solution weighing less than 7 kg including the motor, but robust thanks to the roller screw technology used inside.

1. Male thread on push rod (customization upon request)
2. Front mount
3. Scraper on the front to keep out contaminants
4. Plug for direct grease access on roller screw nut body
5. High quality Ewellix planetary roller screw with backlash elimination
6. High quality SKF bearings
7. Pulleys/belt transmission (ratio 1:1)
8. Servomotor
9. Aluminium body
10. Steel push rod

**Glossary and  
symbols description**

# Glossary

A	
<b>Absolute movement</b>	A move referenced from a fixed absolute zero position.
<b>Acceleration</b>	The change in velocity as a function of time, going from a lower speed to a higher speed.
<b>Accuracy</b>	An absolute measurement defining the difference between expected and actual position.
<b>Actuator</b>	An actuator is a device that is responsible for moving or controlling a mechanism or system also known as cylinder, electromechanical cylinder or linear actuator.
<b>Ambient temperature</b>	The temperature of the cooling medium, usually air, immediately surrounding the actuator or another device.
<b>Angular contact ball bearing</b>	Angular contact ball bearings have raceways in the inner and outer rings that are displaced relative to each other in the direction of the bearing axis. This means that they are designed to accommodate combined loads, i.e. simultaneously acting radial and axial loads.
<b>Anodized</b>	Protective treatment for aluminium that involves subjecting the metal to electrolytic action in a chemical bath, to create a protective film of aluminium oxide with a very smooth finish.
<b>Axial load</b>	Load where the force is acting along the axis of actuator (bearing) in any direction.
B	
<b>Backlash</b>	The amount of play between a set of moveable parts when changing the direction of travel. Typically seen in drive trains, ball/ lead screws and bearings.
<b>Ball bearing</b>	A support device which allows a smooth low friction motion between two surfaces loaded against each other with balls as rolling elements.
<b>Ball screw</b>	A screw assembly which uses a ball nut which contains one or more circuits of recirculating steel balls which roll between the nut and the screw.
<b>Bearing</b>	A support device which allows a smooth low friction motion between two surfaces loaded against each other.
<b>Brushless DC motor</b>	Synchronous motor type that are powered by a DC electric supply through an inverter that produce an AC signal to drive the motor.
<b>Bushing</b>	A cylindrical sleeve inserted into a machine part to reduce friction between moving parts.
C	
<b>Configurator (product)</b>	Name given to the software that uses the configuration string to build-up a specific actuator from an existing list of components and options.
<b>Continuous torque</b>	Is the torque that the motor is able to provide continuously with no limitation in time.
<b>Current</b>	The flow of charge through a conductor.
<b>Cycle</b>	A complete motion of an actuator from the start position via intermediate positions and back to the start position
<b>Cycle time</b>	Time for one complete motion cycle, from the start of the cycle until the start of the next cycle
<b>Cylinder</b>	A mechanical device which produces a linear force to achieve a reciprocating linear motion. There three common types: pneumatic, hydraulic and electromechanical (or electric). The first two use the power of compressed media (gas or liquid) while the latter uses a mechanical device (screw) to transform the rotational input movement of a motor into a linear one.

D	
<b>Deceleration</b>	The change in velocity as a function of time, going from a higher speed to a lower speed.
<b>Duty cycle</b>	The ratio of motor on time and total cycle time within a given cycle of operation (considered under normal ambient working conditions).
<b>Dynamic load rating</b>	Constant that is used to calculate the service life of a screw drive. The value for the dynamic load rating represents the load under which 90% of a sufficient large number of identical screw drives can achieve a service life of one million revolutions.
E	
<b>Efficiency</b>	Ratio of output power versus input power.
<b>Electric cylinder</b>	A self-contained system which converts rotary motion (from a motor) to linear motion.
<b>Electromechanical cylinder</b>	A self-contained system which converts rotary motion (from a motor) to linear motion.
<b>Electrode</b>	The part of a resistance welding gun that facilitates the high voltage current path to the parts being welded.
<b>Equivalent dynamic axial load</b>	Load of constant magnitude over a full motion cycle which has the same influence on the linear unit's service life as the actual fluctuating load.
F	
<b>Foot mount</b>	Mounting plates, attached to front and end of a cylinder, to mount the cylinder in parallel to a flat surface.
<b>Force</b>	The action of one body on another which tends to change the state of motion of that body. Typically described in terms of magnitude, direction and point of application.
<b>Friction</b>	The resistance to motion of two surfaces that are in direct contact.
G	
<b>Gear ratio</b>	This relates to the transmission and conversion of movements, linear and rotary speeds, forces and torques in a geared mechanism. The gear ratio (also known as reduction ratio) is the ratio between the input and output variable, e.g. the ratio of input speed to output speed.
H	
<b>Hall effect sensor</b>	A magnetically controlled transistor switch controlling DC power. It has no moving parts and theoretically unlimited contact life.
<b>Holding force</b>	Maximum external force that can be applied to a stopped actuator, without causing any linear movement. It is usually given by the holding torque of an electromechanical brake applied on the motor.
<b>Humidity (relative)</b>	A ratio that indicates the amount of water vapor in the air. It is usually expressed as a percentage. At any temperature, it is the amount of water vapor in the air, divided by the amount that would be present at saturation.
I	
<b>Inertia</b>	Property of an object that resists a change in motion. It is dependent on the mass and shape of the object. The greater an object's mass, the greater its inertia and the more force is necessary to accelerate and decelerate it.
K	
<b>Keyway</b>	An axially-located groove in the length of a shaft along which a key may be located.
L	
<b>Lead</b>	Describes the axial distance a nut is moving on a screw at one full rotation of either the screw or the nut.
<b>Lead screw</b>	A screw which uses a threaded screw design (e.g. with trapezoidal shaped thread) with sliding surfaces between the screw and nut.
<b>Lifetime</b>	Service life in km that 90% of a sufficiently large group of apparently identical cylinders can be expected to reach or exceed.
<b>Limit switch</b>	A switch that is actuated by some part of motion of a machine or equipment to alter the electrical circuit associated with it.

<b>Linear speed</b>	The linear speed is the change in position as a function of time.
<b>Max. linear speed</b>	Maximum linear speed, a linear unit or a cylinder can reach without damaging the mechanical system. Limiting factors can be the recirculating system of the balls or rollers, or the heat dissipation when using lead screws, or others. If the motor of the cylinder could turn faster, it needs to be limited.
<b>Load</b>	A mass or weight of an application acting on the in axial direction on the push tube.
<b>M</b>	
<b>Mass</b>	The quantity of matter that an object contains.
<b>Moment</b>	Rotational forces applied to a linear axis, typically expressed as yaw, pitch and roll.
<b>Motion profile</b>	A method of describing a move operation in terms of time, position and velocity. Typically, velocity is characterized as a function of time or distance which results in a triangular or trapezoidal profile.
<b>Motor</b>	A device which converts electrical energy into mechanical energy.
<b>O</b>	
<b>O-ring</b>	A ring of synthetic rubber with a circular cross-section, used as a gasket or seal.
<b>Overheating</b>	The heat in a system is mostly dissipated into the surrounding air. Dissipation can be accelerated by various forms of ventilation. In case the dissipation level is lower than the heat generation, overheating takes place.
<b>P</b>	
<b>Peak force</b>	The peak force is the maximum force an actuator can push or pull for a short time (peak), without being mechanically damaged or overheating.
<b>Peak torque</b>	The peak force is the maximum torque a motor can provide for pull for a short time (peak), without being mechanically damaged or overheating.
<b>PLC (programmable logic controller)</b>	An industrial digital computer that is used to control machines and processes by continuously monitoring analog and digital inputs and making decisions based on customer programs.
<b>Positioning accuracy</b>	Is the maximum deviation between the actual position and the target position, as defined in VDI/DGQ 3441 norms.
<b>Power</b>	How much work is done in a specific amount of time.
<b>Proximity sensor</b>	A device for sensing a position of an actuator or application. Proximity sensors supply either a sourcing or sinking signal to a device such as a programmable logic controller.
<b>R</b>	
<b>Radial load</b>	Load where the force is acting perpendicular to the axis of the actuator.
<b>Repeatability</b>	The ability of a positioning system to return to an exact location during operation (from the same direction with the same load and speed).
<b>Resolver</b>	A feedback device consisting of a stator and rotor that provides position and velocity information to the drive for motor commutation.
<b>RMS</b>	The root mean square is the square root of a mean square value.
<b>Rod cylinder</b>	A cylinder using a rod attached to its piston to transmit force.
<b>Roller screw</b>	A screw assembly which uses a roller nut which contains guided steel rollers which are rotating around their own axis and around the screw (planetary rollers).
<b>S</b>	
<b>Screw assembly</b>	Device which converts rotary motion into linear motion.
<b>Service life</b>	The nominal life is expressed by the number of revolutions (or number of operating hours at constant rotary speed) that will be attained or exceeded by 90% of a sufficiently large number of identical screw drives before the first signs of material fatigue become evident.
<b>Servomotor</b>	A motor which is used in closed loop systems where feedback is used to control motor velocity, position or torque.
<b>Spur gear</b>	Is a gear or a system of gearing having radial teeth parallel to the axle.
<b>Static axial force</b>	Maximum axial force which can be applied on a linear unit only if it is not moving.
<b>Stiffness</b>	Is the rigidity of an object, representing its resistance to deformation from an applied force.
<b>Stroke length</b>	The linear distance that the push tube of a cylinder can extend or retract.

---

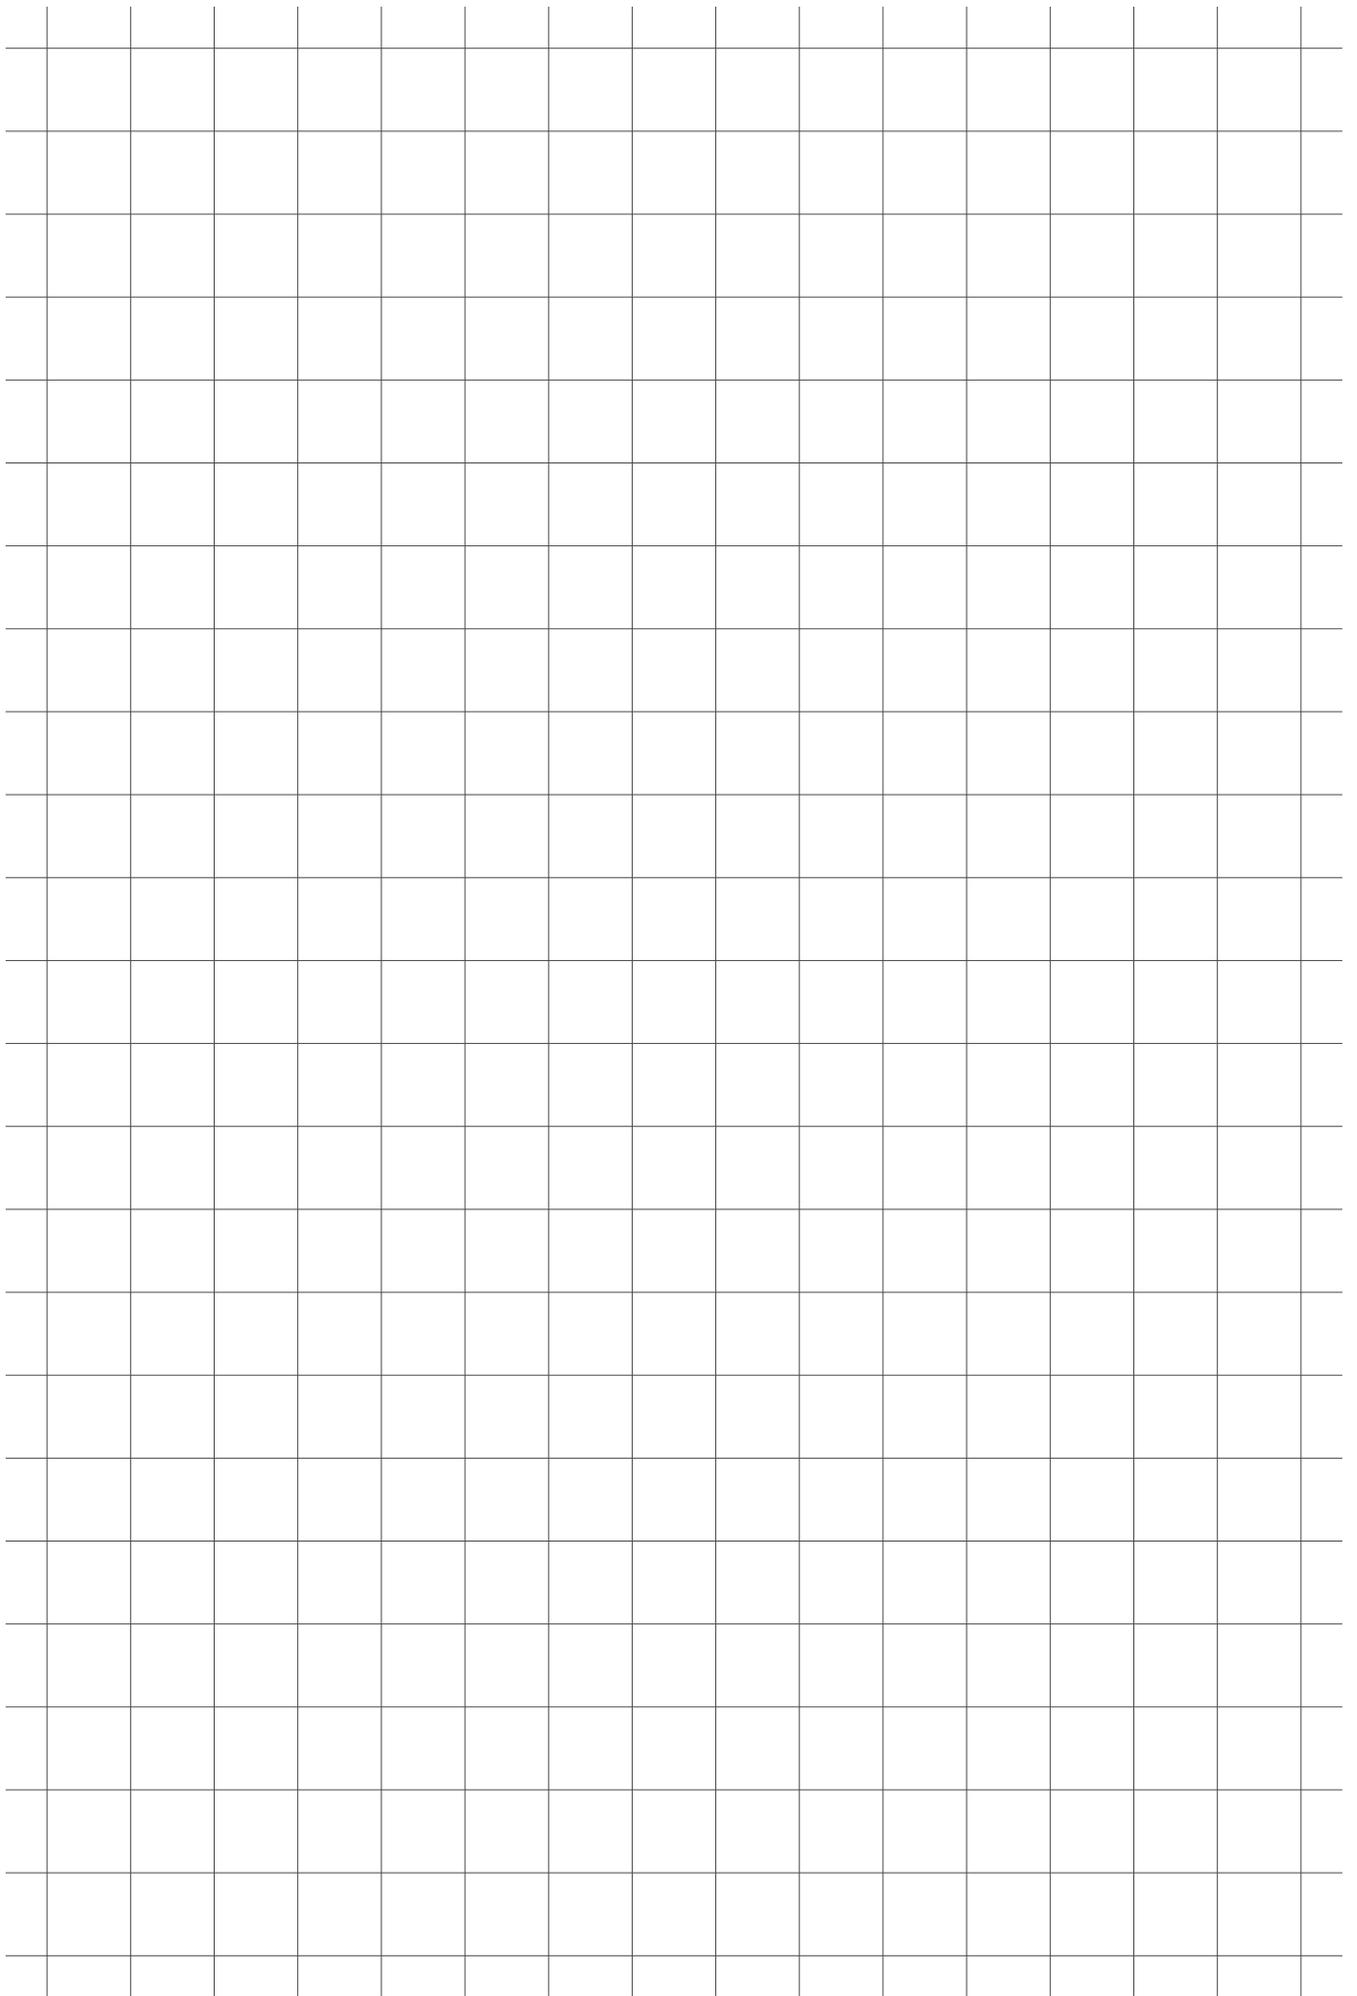

<b>T</b>		
	<b>Thermal load</b>	The thermal load describes the force which the actuator can permanently move without overheating. The thermal load is calculated by a formula in respect of changing load conditions over different time phases of a full motion cycle.
	<b>Torque</b>	A measure of angular force which produces rotational motion.
<b>U</b>		
	<b>Units (metric)</b>	A decimal system of weights and measures based on the kilogram and meter.
<b>V</b>		
	<b>Volt</b>	Difference in electrical potential between two points.
<b>W</b>		
	<b>Watt</b>	A unit of power or a rate of doing work. The power dissipated by a one-ohm resistor with one ampere of current is one watt.
	<b>Weight</b>	Force of gravity acting on a body. Determined by multiplying the mass of the object by the acceleration due to gravity.

# Symbols description

A				
a	m/s <sup>2</sup>	<b>Acceleration</b>		The change in velocity as a function of time, going from a lower speed to a higher speed.
a <sub>max</sub>	m/s <sup>2</sup>	<b>Max. acceleration</b>		The maximum allowed change in velocity as a function of time from a lower speed to a higher speed. Exceeding this value can cause damages.
C				
C	kN	<b>Dynamic load capacity</b>		Constant that is used to calculate the service life of a ball or roller screw. The value for the dynamic load rating represents the load under which 90% of a sufficient large number of identical screws can achieve a service life of one million revolutions.
D				
D	%	<b>Duty cycle of the cylinder</b>		The ratio of active time at full load and total cycle time within a given cycle of operation.
D <sub>unit</sub>	%	<b>Duty cycle of the linear unit</b>		The ratio of active time and total cycle time within a given cycle of operation.
d <sub>screw</sub>	mm	<b>Screw diameter</b>		Describes the outer diameter of the screw shaft.
E				
η	%	<b>Efficiency</b>		Ratio of output power versus input power.
η <sub>lu</sub>	%	<b>Efficiency of the linear unit</b>		Ratio of output power versus input power of the linear unit.
F				
F	N	<b>Force (cylinder) or load (application)</b>		The action of one body on another which tends to change the state of motion of that body. Typically described in terms of magnitude, direction and point of application. The force is related to the capability of the cylinder while the load is related to the mass or weight of an application acting on the axial direction on the push tube.
F <sub>Amax</sub>	N	<b>Maximum dynamic axial load of the application</b>		Maximum axial push or pull load which is needed to fulfill the specifications of the application.
F <sub>c</sub>	N	<b>Continuous force at max speed</b>		The continuous force at max speed describes the force the cylinder can permanently move at maximum allowed linear speed, without overheating.
F <sub>c0</sub>	N	<b>Continuous force at zero speed</b>		The continuous force at zero speed describes the force the cylinder can permanently hold without overheating and without using a brake.
F <sub>cont</sub>		<b>Continuous force curve</b>		A curve that represents the continuous force an actuator can permanently move at maximum allowed linear speed, without overheating.
F <sub>Hold</sub>	kN	<b>Holding force of the brake</b>		Describes the maximum axial load the engaged brake (optional motor brake) can hold if the motor is disabled. This value must not exceed the maximum axial force of the cylinder.
F <sub>m</sub>	N	<b>Equivalent dynamic axial load</b>		Load of constant magnitude over a full motion cycle which has the same influence on the linear unit's service life as the actual fluctuating load.
F <sub>max</sub>	N	<b>Maximum dynamic axial force</b>		The maximum dynamic axial force describes the maximum force an electric cylinder can deliver during movements without damaging parts. The acceleration/ deceleration of masses need to be considered.
F <sub>maxL10</sub>	N	<b>Maximum dynamic axial force</b>		Maximum dynamic axial force usable to apply the theoretical lifetime calculation (L10).
F <sub>max0</sub>	N	<b>Max. static axial force</b>		Maximum axial force which can be applied on a linear unit only if it is not moving.

$F_p$	N	<b>Peak force</b>	The peak force describes the maximum force the cylinder can push or pull for a short time, without being mechanically destroyed or by overheating. The length of the peak is depending on the temperature of the system when the peak is initiated.
$F_{p0}$	N	<b>Peak force at zero speed</b>	The peak force at zero speed is the maximum force the cylinder can hold for a short time without using a brake.
$F_{peak}$		<b>Peak force curve</b>	A curve that represents the continuous force an actuator can push or pull for a short time, without being mechanically destroyed or by overheating. The length of the peak is depending on the temperature of the system when the peak is initiated.
<b>I</b>			
$i$	#	<b>Gear reduction</b>	Describes the factor between the number of revolutions of the input of the gear divided by the number of revolutions of the output of the gear. A gear reduction 2 means that the output of the gear (linear unit side) is turning with half speed compared to the input of the gear (motor side). Using a gear reduction enables for using smaller motors with less torque to bring higher force but with lower speed.
$I$	A	<b>Nominal Current</b>	Is the nominal current consumption of the motor.
$I_{peak}$	A	<b>Peak current</b>	Is the maximum current consumption of the motor for a short period of time.
IP		<b>Degree of protection</b>	International protection (also ingress protection) describes the protection of a product with two digits. The first digit describes the protection against dust, the second against water. The higher the value the better the protection.
<b>J</b>			
$J$	$10^{-4}$ kgm <sup>2</sup>	<b>Inertia</b>	Property of an object that resists a change in motion. It is dependent on the mass and shape of the object. The greater an object's mass, the greater its inertia and the more force is necessary to accelerate and decelerate. As an electric cylinder is available in different lengths, the inertia is typically given for stroke 0, followed by an inertia indication $\Delta J$ for each additional 100 mm.
$J_{brake}$	$10^{-4}$ kgm <sup>2</sup>	<b>Inertia of the brake</b>	Property of an object that resists a change in motion. It is dependent on the mass and shape of the object. The greater an object's mass, the greater its inertia and the more force is necessary to accelerate and decelerate. As the brake is typically an option, this value has to be added to the Inertia of the electric cylinder.
$J_{lu}$	$10^{-4}$ kgm <sup>2</sup>	<b>Inertia of the linear unit</b>	Property of an object that resists a change in motion. It is dependent on the mass and shape of the object. The greater an object's mass, the greater its inertia and the more force is necessary to accelerate and decelerate. As the linear unit is available in different lengths, the inertia is typically given for stroke 0, followed by an inertia indication $\Delta J$ for each additional 100 mm.
<b>L</b>			
$L_{10 dist}$	km	<b>Lifetime distance</b>	Service life in km that 90% of a sufficiently large group of apparently identical cylinders can be expected to reach or exceed.
<b>M</b>			
$m$	kg	<b>Weight</b>	Force of gravity acting on a body. Determined by multiplying the mass of the object by the acceleration due to gravity.
$\Delta m$	kg	<b>Weight difference</b>	As electric cylinders are available in different lengths, the weight is typically given for stroke 0, followed by a weight indication $\Delta m$ for each additional 100 mm.
$m_{arot0}$	kg	<b>Weight of the anti-rotation device</b>	The weight of the optional anti-rotation device has to be added to the weight of the cylinder.
$m_{brake}$	kg	<b>Weight of the brake</b>	The weight of the optional brake has to be added to the weight of the cylinder.
$m_{lu}$	kg	<b>Weight of the linear unit</b>	As the linear unit is available in different lengths, the weight is typically given for stroke 0, followed by a weight indication $\Delta m$ for each additional 100 mm.
$M$	Nm	<b>Torque</b>	A measure of angular force applied to a linear axis to produce rotational motion.
$M_{Ac}$	Nm	<b>Required continuous torque</b>	A measure of continuous angular force (torque) a motor has to deliver without overheating.
$M_{Amax}$	Nm	<b>Required maximum torque of the motor</b>	Maximum angular force (torque) of a motor which is required that the cylinder is able to push or pull the maximum load of the application.
$M_{max}$	Nm	<b>Maximum torque</b>	The maximum torque is the upper limitation of the torque. Exceeding this value can cause damages of related parts.

N			
$n_{\text{cycles}}$	#	<b>Number of cycles</b>	The number of motion cycles a cylinder has to have without damage during the expected life of the application.
$n_{\text{max}}$	1/min	<b>Max. rotational speed</b>	Describes the maximum allowed number of full rotations of an axis. Exceeding this value can cause damages.
P			
P	W	<b>Nominal Power</b>	Nominal power of the motor, given by multiplying the nominal voltage and the nominal current.
$p_{\text{screw}}$	mm	<b>Screw lead</b>	Describes the axial distance a nut is moving on a screw at one full rotation of either the screw or the nut.
R			
R	$\Omega$	<b>Resistance</b>	The opposition to the flow of charge through a conductor.
S			
s	mm	<b>Stroke</b>	The linear distance that the push tube of a cylinder can extend or retract.
$s_0$	mm	<b>Internal over stroke</b>	Additional stroke which is not part of the specified stroke length of the cylinder. It is used to prevent the screw nut touching the mechanical end stops when moving over the full specified stroke.
$s_{\text{backlash}}$	mm	<b>Backlash</b>	Axial play that the cylinder push tube has without turning the screw. It's equivalent with the mechanical axial play of the inner parts of the cylinder.
$s_{\text{cycle}}$	m	<b>Distance travelled per motion cycle</b>	Travelled distance of a push tube for a full motion cycle, from the start to the next start in both directions.
$s_{\text{max}}$	mm	<b>Maximum stroke</b>	The maximum stroke describes the mechanical limitation which a cylinder can extend or retract. Limiting factors are side loads (buckling), speed (wobbling of the screw inside), limitations in the manufacturing process and others.
T			
t	s	<b>Time</b>	Time in seconds which is needed for a certain activity.
$t_{\text{cycle}}$	s	<b>Cycle time</b>	Time for one complete motion cycle, from the start of the cycle until the start of the next cycle.
$t_L$	h	<b>Required lifetime in hours</b>	The lifetime of a cylinder in hours which is required to serve an application without damage during the expected life of the application.
T	Nm	<b>Torque</b>	A measure of angular force applied to a linear axis to produce rotational motion.
$T_{\text{ambient}}$	$^{\circ}\text{C}$	<b>Ambient temperature</b>	Temperature of the environment around the object.
U			
U	V	<b>Nominal voltage</b>	Is the supply voltage required by the electric motor.
V			
v	mm/s	<b>Linear speed</b>	The linear speed is the change in position as a function of time.
$v_{\text{max}}$	mm/s	<b>Max. linear speed</b>	Maximum linear speed, a linear unit or a cylinder can reach without damaging the mechanical system. Limiting factors can be the recirculating system of the balls or rollers, or the heat dissipation when using lead screws, or others. If the motor of the cylinder could turn faster, it needs to be limited.
$v_{\text{min}}$	mm/s	<b>Min. linear speed</b>	Minimum linear speed of a LEMC-A cylinder equipped with asynchronous motors that can be adjusted through the integrated frequency inverter.
