

# Two-bearing housings

## PD series

### Bearing types

- Single row deep groove ball bearings
- Single row angular contact ball bearings
- Single row cylindrical roller bearings

### Bearing dimension series

- 62, 63
- 72, 73
- NU 22, NU 3, NJ 22, NJ 23, NJ 2, NJ 3

### Shaft diameter range

- 25 to 120 mm

### Shaft-bearing combination

- On a stepped shaft with bearings on a cylindrical seat

### Seals

- Felt strip
- V-ring

### Lubrication

- Grease
- Oil lubrication (optional)

### Materials

- Grey cast iron

### Mounting

- Four-bolt mounting

### Compliance to standards

- Not standardized

SKF two-bearing housings were originally developed for fan shafts with an overhung impeller, but are also suitable for other applications with similar shaft arrangements.

Compared to the conventional shaft arrangement where two self-aligning bearings are mounted in separate plummer (pillow) block housings, two-bearing housings provide several advantages including improved running accuracy and quieter operation.

PD two-bearing housings can also be supplied as ready-to-mount units.

## Two-bearing housings PD series

### Designation system for PD two-bearing units

**PDPF 220**  
**PDNB 305 DD**

#### Housing series

PDN	Housing for normal radial and axial loads
PDP	Housing for predominant or alternating axial loads
PDR	Housing for heavy radial loads

#### Size identification

	Non-locating bearing position	Locating bearing position	Housing series
<b>A</b>	Deep groove ball bearing	Two angular contact ball bearings	PDN
<b>B<sup>1)</sup></b>	Deep groove ball bearing	Deep groove ball bearing	PDN
<b>D</b>	Cylindrical roller bearing	Cylindrical roller bearing	PDN
<b>E</b>	Cylindrical roller bearing	Deep groove ball bearing	PDN
<b>F<sup>1)</sup></b>	Cylindrical roller bearing	Two angular contact ball bearings	PDN, PDP
<b>J<sup>1)</sup></b>	Cylindrical roller bearing	Cylindrical roller bearing + Deep groove ball bearing	PDR
<b>L</b>	Spherical roller bearing	Spherical roller bearing	PDN

#### Size identification

<b>2(00)</b>	Housing for bearings in the 62, 72, NU 2, NJ 2, NJ 22, NJ 23, 222 and 223 series
<b>3(00)</b>	Housing for bearings in the 63, 73, NU 3 and NJ 3 series
<b>..(00)</b>	Size code of the bearings, (00) x 5 = bearing bore diameter [mm]

#### Suffixes

<b>DD</b>	Unit supplied with shaft spacers and a large bore in the covers at both sides
<b>U</b>	Unit supplied without shaft spacers (PDP and PDR units only)

<sup>1)</sup> Standard units include PDNB, PDPF and PDRJ

Fig. 1

## Standard housing design

PD two-bearing housings are non-split housings with two bearing seats (→ **fig. 1**). They consist of a housing body and two covers that are bolted to the body with either four or six bolts. The housings have four holes drilled into the feet for attachment bolts.

PD housings are available in three series, each similar in their external design, but accommodating different bearing arrangements:

- PDN series, for normal radial and axial loads
- PDP series, for predominant or alternating axial loads
- PDR series, for heavy radial and normal axial loads

### Features and benefits

PD housings have the following features and benefits:

#### Compact design

The bearings are incorporated in one housing, which saves space.

#### Smooth running

The two bearing seats are concentric. Since bearing misalignment is avoided, rigid bearings can be used. The resulting stiff arrangement provides a high degree of running accuracy and enables high speeds.

#### Quiet operation

The accurate alignment of the rigid bearings in one housing enables quiet operation. For units with the designation PDNB, a wave spring washer in the smaller housing range further reduces noise levels.

#### Available as units

PD housings can also be supplied as units, complete with bearings and shaft. These ready-to-mount units are assembled and greased at the factory, saving time and reducing the risk of contaminating or damaging the bearings during assembly.

#### Easy handling

Large housings have two eye bolts for safe and easy handling.

### Housing material

PD two-bearing housings and their covers are made of grey cast iron.

### Paint, corrosion protection

PD housings are painted blue (RAL 5007) using a solvent based alkyd paint. The paint protects the housing in accordance with ISO 12944-2, corrosivity category C2 (i.e. exterior atmospheres with low levels of pollution, interior atmospheres where condensation may occur). The paint is not affected by most lubricating or engine oils, cutting fluids or alkalescent washing chemicals. Housings can be repainted with most water or solvent based 1- or 2-component paints.

Unpainted surfaces are protected with a solventless rust inhibitor.

### Dimension standards

The dimensions of PD two-bearing housings are not standardized either nationally or internationally.

### Housing variants

In addition to standard design PD housings, the following variants are available on request:

- housings for oil bath or circulating oil lubrication systems
- housings for vertical shaft arrangements

For additional information, contact the SKF application engineering service.

### Sealing solutions

PD two-bearing housings are designed for two sealing solutions:

- a V-ring seal, for housings in the PDN 2 and PDP series (→ **fig. 2**)
- a felt strip and a V-ring seal, for housings in the PDN 3 and PDR series (→ **fig. 3**)

**Table 1**, provides an overview of the properties and suitability of each sealing solution. This information should be used as a guideline, which cannot substitute for testing the seal in its application.

Housings in the PDN 3 and PDR series have felt strips, which are mounted in a groove in the cover. At circumferential speeds above 4 m/s, a small gap forms between the felt and the seal counterface.

The outboard V-ring seals (for all housing series) provide additional protection against contaminants. They can accommodate circumferential speeds up to 7 m/s.

PD housings are supplied with seals but the seals can also be ordered separately.

Fig. 2

Fig. 3

Table 1

## Standard seals for PD two-bearing housings

**Seal**

Type	V-ring seal	Felt strip and V-ring seal
Housing series	PDN 2, PDP	PDN 3, PDR
Material	nitrile rubber	felt, nitrile rubber

**Application conditions and requirements**

Temperature [°C]	-40 to +100	-40 to +100
Temperature [°F]	-40 to +210	-40 to +210
Max. circumferential speed <sup>1)</sup> [m/s]	7 <sup>2)</sup>	4 <sup>3)</sup>
Low friction	++	-
Shaft tolerance class	→ page 564	→ page 564
Shaft roughness $R_a$ [μm]	3,2	3,2

**Sealing suitability**

Dust	+	+
Fine particles	+	+
Coarse particles	+	+
Chips	--	+
Liquids when sprayed	+	+
Direct sunlight	--	+

Symbol: ++ very suitable  
+ suitable  
- limited suitability  
-- unsuitable

<sup>1)</sup> To convert circumferential speeds to rotational speeds, refer to **table 7** on **page 37**.

<sup>2)</sup> If located axially, higher speeds are possible.

<sup>3)</sup> At higher speeds, a small gap forms between the felt and the shaft.

### Design considerations

For general information about system design, refer to the following sections:

- *Shaft seat tolerances* (→ [skf.com/bearings](http://skf.com/bearings))
- *Load carrying capacity* (→ [page 44](#))
- *Specifications for shafts and housing support surfaces* (→ [page 45](#))

For additional information about rolling bearings, refer to the product information available online at [skf.com/bearings](http://skf.com/bearings).

### Shaft-bearing combinations

PD two-bearing housings accommodate bearings on a cylindrical seat on stepped shafts.

### Standard bearing arrangements

PD two-bearing housings can accommodate different bearing arrangements, depending on the series.

#### Housings in the PDN series

The bearing arrangement for housings in the PDN series comprises:

- two single row deep groove ball bearings in the 62 series for housings in the PDN 2 series (→ [fig. 4](#))
- two single row deep groove ball bearings in the 63 series for housings in the PDN 3 series (→ [fig. 5](#))

The bearing arrangements are intended for normal load conditions and relatively high speed operation. The arrangement for housings in the PDN 3 series can accommodate heavier loads than PDN 2 series housings.

A wave spring washer, supplied with housings up to size 218 or 316, preloads the bearings against each other to reduce noise levels. Units with spring-loaded bearings can accommodate axial loads in one direction only (→ [Mounting, page 568](#)).

Housings in the PDP series can also be used for other bearing combinations (→ *Non-standard bearing arrangements, page 562*).

#### Housings in the PDP series

The bearing arrangement for housings in the PDP series comprises (→ [fig. 6](#)):

- a single row cylindrical roller bearing in the NU 22 ECP series, in the non-locating bearing position
- a pair of universally matchable single row angular contact ball bearings in the 72 series, mounted back-to-back in the locating bearing position

This bearing arrangement accommodates axial loads in both directions and can support heavier loads than bearings in PDN series housings.

Housings in the PDP series can also accommodate other bearing combinations.

Fig. 5

Fig. 6

## Two-bearing housings PD series

### Housings in the PDR series

The bearing arrangement for housings in the PDR series comprises (→ **fig. 7**):

- a single row cylindrical roller bearing in the NU 3 ECP series, in the non-locating bearing position
- a cylindrical roller bearing in the NU 3 ECP series in combination with a single row deep groove ball bearing in the 63 series (with C3 clearance), in the locating bearing position

The deep groove ball bearing acts as a pure thrust bearing, accommodating the axial loads in both directions, and is mounted with radial clearance in the housing. To prevent the outer ring from turning, an O-ring is inserted in a groove in the cover that abuts the outer ring.

The bearings support heavier radial loads than bearings in both PDN and PDP series housings.

### Non-standard bearing arrangements

Housings in the PDN series are designed to accommodate two deep groove ball bearings. For special applications, the housings can be fitted with various combinations of deep groove ball bearings, angular contact ball bearings, cylindrical roller bearings and spherical roller bearings.

SKF can supply the following combinations, available as assembled units (→ **fig. 8**):

- PDNA .. DD units, incorporating a deep groove ball bearing in the non-locating bearing position and a pair of universally matchable angular contact ball bearings, mounted back-to-back, in the locating bearing position. Smaller housings accommodate axial loads in only one direction, while larger housings can withstand axial loads in both directions (**a**)
- PDND units, incorporating an NJ design cylindrical roller bearing on each end to form a cross-located ("floating") bearing arrangement (**b**)
- PDNE units, an NJ design cylindrical roller bearing and a deep groove ball bearing to form a cross-located ("floating") bearing arrangement (**c**)
- PDNF .. DD units, incorporating an NJ design cylindrical roller bearing and a pair of universally matchable angular contact ball bearings, mounted back-to-back, to form a cross-located ("floating") bearing arrangement (**d**)
- PDNL units, incorporating a spherical roller bearing on each end to form a cross-located ("floating") bearing arrangement (**e**)

Fig. 8

### Bearing arrangements

Typically, PD two-bearing housings accommodate a locating and a non-locating bearing. In some applications, however, both bearings are used to locate the shaft axially, each in one direction. This is called a cross-located (“floating”) bearing arrangement.

### Load carrying capacity

PD two-bearing housings are intended for loads acting perpendicularly toward the support surface. If the housing is supported over its four feet and the loads are purely perpendicular, loads are limited only by the bearings.

Housings in the PDN series that have bearings preloaded with a wave spring washer accommodate axial loads in one direction only.

### Operating temperature

The permissible operating temperature is mainly limited by the seals and lubricant. For temperature limits of SKF bearings and lubricants, refer to the product information available online at [skf.com/bearings](http://skf.com/bearings). For temperature limits of the seals used in PD housings, refer to **table 1** on **page 559**.

The housing material does not set any additional temperature limits, except for very low temperature applications where impact strength could be a factor.

The housing paint is heat resistant up to 80 °C (175 °F) material temperature or 100 °C (210 °F) ambient temperature.

When temperatures outside the permissible range are expected, contact the SKF application engineering service.

### Operating speed

The permissible operating speed of the incorporated bearings is limited by the V-ring and felt seals, but not by the housing. Speed limits of the seals are listed in **table 1** on **page 559**.

### Shaft specifications

Shafts for two-bearing housings can be machined according to the recommended dimensions provided in **product tables 13.4** to **13.7**. The bearing seats should be machined to the tolerance classes listed in **table 2**. The

accuracy of form should be to tolerance grade IT5 for shaft diameters up to and including 60 mm and IT6 for larger diameter shafts. At the seal position, the shaft (or shaft sleeve) should comply with the same tolerance classes as the bearing seat.

SKF also supplies pre-machined shafts to fit PD housings. Their designations are provided in the product tables. The bearing seats and shaft ends are machined to the tolerance classes listed in **table 2** and **table 3** respectively.

Shafts are supplied with two keys and two end plates with attachment screws.

Table 2

Bearing seat tolerance classes

Shaft diameter d <sub>a</sub>		Tolerance class <sup>1)</sup> for housing series PDN	PDP with angular contact ball bearings	cylindrical roller bearings	PDR
over	incl.				
mm		–			
– 100	100 –	k6 k6	k6 m6	m6 m6	m6 m6

<sup>1)</sup> The recommended tolerance classes are intended for light loaded bearings only (P < 0,05 C, see also [skf.com/bearings](https://www.skf.com/bearings)). Tighter fits are required for heavier loads. For additional information, contact the SKF application engineering service.

Table 3

### Attachment bolt recommendations

In typical applications, 8.8 class hexagon head bolts in accordance with ISO 4014 can be used together with washers. If loads do not act perpendicularly towards the support surface, it may be necessary to use stronger, 10.9 class bolts.

SKF housings can withstand loads resulting from tightening the attachment bolts to the values recommended by bolt manufacturers (→ **table 4**). They are valid for oiled, but otherwise untreated thread surfaces. SKF cannot confirm that tightening to the recommended value will provide sufficient anchoring. Make sure that attachment bolts and a sufficiently strong support can accommodate all occurring loads.

Table 4

Cover bolts and attachment bolts							
Housing series		PDP	PDR	Cover bolts	Tightening	Attachment bolts

<sup>1)</sup> Recommended by bolt manufacturers.

## Lubrication

Standard PD two-bearing housings are designed for grease lubrication. Housings for oil lubrication are available on request.

The lubricant should be selected based on the operating conditions of the bearings. For additional information about lubricant selection, refer to the product information available online at [skf.com](http://skf.com).

### Flinger rings

PD housings are supplied with inboard flinger rings made of grey cast iron (→ **fig. 9**). The flinger rings serve to retain grease at the bearing position and to prevent over-lubrication. The excess grease is collected in the large space in the middle of the housing.

### Initial grease fill

If no other requirements exist, the free space in the bearings should be completely filled with grease and the free space between the cover and flinger ring should be filled to 100%.

### Initial grease fill for PD units

PD units are greased at the factory with SKF LGMT 2, a high-quality mineral oil based grease with a lithium thickener and good rust inhibiting properties. The operating temperature range of the grease is  $-30$  to  $+110$  °C ( $-20$  to  $+230$  °F).

## Relubrication

Relubrication is possible via two G  $1/4$  or G  $1/8$  grease fittings (depending on size), one on each end of the housing (→ **fig. 10**). There is minimal risk of over-greasing because excess grease is collected in the large space in the middle of the housing. When applying grease via the grease fittings, the shaft should be rotating.

SKF recommends replenishing the housings with SKF LGMT 2, a high-quality mineral oil based grease with a lithium thickener and good rust inhibiting properties. For vertical shaft arrangements, SKF LGMT 3 grease should be used with half the interval required for a similar horizontal application.

To calculate the relubrication interval and the quantity of grease needed for replenishment, refer to the SKF catalogue *Rolling bearings* or [skf.com/bearings](http://skf.com/bearings).

## Oil lubrication

Where high speeds preclude the use of grease as a lubricant, large PD housings can be modified for oil bath or circulating oil lubrication systems. The housings are fitted with special oil seals. For additional information, contact the SKF application engineering service.

Fig. 9

Fig. 10

### Mounting

PD housings must be mounted properly, using the correct tools. All the associated components must meet certain basic requirements and the support surface should meet the specifications provided under *Housing support surfaces* (→ **page 45**).

The housings have two markings (→ **fig. 11**):

- A “square” on one end denotes the position of the wider of the two bearing seats.
- A “triangle” on the other end indicates the direction in which the predominant axial load should be applied.

For information about mounting rolling bearings, refer to the *SKF bearing maintenance handbook* or [skf.com/mount](http://skf.com/mount).

### Mounting PDN series housings

The wave spring washers, supplied with smaller housings in the PDN series, should be inserted between the bearing and the cover on the housing end marked with a triangle. The rotary components (impeller, pulley, coupling etc.) must be arranged so that the axial load  $F_a$  produced in operation acts in the direction indicated by the triangle. SKF recommends using a hydraulic nut or press for these mounting operations.

### Mounting PD units

Installing PD units is simple because the unit just needs to be bolted to the support surface. The rotary components are then mounted onto the finished shaft ends secured by the keys, end plates, and attachment screws (with spring washers) provided.

Support the shaft properly when pressing components onto the shaft to prevent the mounting force acting on the bearings. Mounting instructions are available on request.

### Torque specifications

Cover bolts should be tightened to the torque values listed in **table 4** on **page 566**. The cover bolts are in accordance with ISO 4017.

For information about attachment bolts, refer to *Attachment bolt recommendations* on **page 566**.

Fig. 11

## Condition monitoring

If connections for condition monitoring sensors are required, contact the SKF application engineering service.

## Accessories

The following accessories are available for PD two-bearing housings:

- Automatic lubricators: SKF SYSTEM 24 and SKF MultiPoint
- Grease meter: LAGM 1000E

For additional information, refer to *SKF tools and products* (→ **page 47**).

### Ordering information

#### PD two-bearing housings

Housings in the PDN series are supplied with the following components:

- housing
- 2 covers, including 8 or 12 hexagon head bolts and spring washers depending on size
- 2 flinger rings
- 1 wave spring washer (up to and including size 218 for housings in the PDN 2 series, and size 316 for housings in the PDN 3 series)
- 2 seals (V-ring seals for housings in the PDN 2 series; V-ring seals and felt strips for housings in the PDN 3 series)

Housings in the PDP series are supplied with the following components:

- housing, including 2 eye bolts for housings size 224
- 2 covers, including 12 hexagon head bolts and washers
- 2 flinger rings
- 2 locating rings
- 2 spacer sleeves
- 2 shaft sleeves
- 2 V-ring seals

Housings in the PDR series are supplied with the following components:

- housing, including 2 eye bolts for housings from sizes 320 to 324
- 2 covers, including 12 hexagon head bolts and washers
- 2 flinger rings
- 2 spacer sleeves
- 2 shaft sleeves
- 2 seals (V-ring seals and felt strips)
- 1 O-ring

The bearings and shaft must be ordered separately. Shafts are supplied with two keys, and two end plates with attachment screws and spring washers.

Housings in the PDP and PDR series can be supplied without shaft sleeves. They are identified by the designation suffix U, e.g. PDR 315 U.

#### Order example

One PD housing is required for two 6309 bearings. The following components should be ordered:

- 1 housing PDN 309
- 1 shaft VJ-PDNB 309
- 2 bearings 6309

#### PD two-bearing units

PD units are supplied assembled and ready-to-mount, complete with bearings and shaft.

#### Order example

One PD housing is required for two 6309 bearings. The following items should be ordered:

- 1 unit PDNB 309
